**Tag Counting and Monitoring in Large-Scale RFID Systems** Jihong Yu, Lin Chen, 2018-06-06 This book provides a comprehensive treatment of the theoretical foundation and algorithmic tools necessary in the design of efficient tag counting and monitoring algorithms in emerging RFID systems. The book delivers an in-depth analysis on the following problems ranging from theoretical modeling and analysis to practical algorithm design and optimization: Stability analysis of the frame-slotted Aloha protocol, the de facto standard in RFID tag counting and identification; Tag population estimation in dynamic RFID systems; Missing tag event detection in the presence of unexpected tags; Missing tag event detection in multi-group, multi-region RFID systems. The target readers are researchers and advanced-level engineering students interested in acquiring in-depth knowledge on the topic and on RFID systems and their applications.

*Toward EPC Global Chipless RFID Tag Design* Md Shakil Bhuiyan, 2014 Radio Frequency Identification (RFID) is a disruptive technology that has penetrated almost every facade of modern civilization. RFID is an automated identification system that uses radio frequency waves to transmit data between a tag and a reader. Penetration of RFID in low-cost item-level tagging is hindered due to the high price of tags. The high cost of chipped tags stalled many ambitious projects such as low-cost and perishable item-level tagging for retail supply chain management, logistics, pharmaceuticals, and luggage handling, to just name a few. The tag can be made low-cost by removing the microchip in the tag. The aim is to make the chipless tag that costs sub-cents and is compatible with the current Electronic Product Code (EPC) Global standard. A few research groups have been working in the domain of chipless RFID tags. The big challenge of chipless RFID tag development is to incorporate 64 data bits in a half the credit card size. Recently reported chipless RFID tags can meet neither the bit nor the real estate requirement. The thesis has presented numerous microwave passive designs to develop compact chipless tags with high data capacity. The goal is to develop fully printable uniplanar chipless RFID tags that offer: i) high spectral efficiency meaning maximum number of data bits possible in the ultra-wide band (UWB) frequency range from 3.1 to 6 GHz; ii) high spatial efficiency meaning very compact design of multiple data encoding elements in prescribed surface area of the tag; and iii) operational flexibility such as orientation-insensitive tag design. To fulfill the thesis goal, a set of high data capacity, spectrally efficient, and compact chipless tags are designed. The designed chipless tags are: i) polarization diversity (PD)-based retransmission-type tag; ii) dual-band modified complementary split-ring resonator (MCSRR)-based tag; iii) single-polarized radar cross-section (RCS)-based tag; iv) dual-polarized RCS-based tag; v) multi-dimensional data encoding (MDDE)-based tag; and vi) polarization-insensitive (PI) tag. To realize the aforementioned chipless tags, a number of compact resonant structures with different polarization attributes such as single-polarized, dual-polarized, and polarization-insensitive have been proposed. A chipless RFID tag reader is also developed to read the designed tags in a laboratory setting. Successful reading of the designed tags using the developed reader has been accomplished for both mono-static and bi-static tag reading arrangements. The developed chipless RFID system finds potential applications in authentications of Australian polymer banknote and secured documents, tagging of goods and consumables, products, bus tickets, stamps, and pharmaceuticals.
