RFID tag development is to incorporate 64 data bits in a half the credit card size real estate. Recently reported chipless RFID tags can meet neither the bit nor the real estate requirement. The thesis has presented numerous microwave passive designs to develop compact chipless tags with high data capacity. The goal is to develop fully printable uniplanar chipless RFID tags that offer i high spectral efficiency meaning maximum number of data bits possible in the ultra wide band UWB frequency range from 3.1 to 6 GHz ii high spatial efficiency meaning very compact design of multiple data encoding elements in prescribed surface area of the tag and iii operational flexibility such as orientation insensitive tag design. To fulfil the thesis goal a set of high data capacity spectrally efficient and compact chipless tags are designed. The designed chipless tags are i polarization diversity PD based re transmission type tag ii dual band modified complementary split ring resonator MCSRR based tag iii single polarized radar cross section RCS based tag iv dual polarized RCS based tag v multi dimensional data encoding MDDE based tag and vi polarization insensitive PI tag. To realize the aforementioned chipless tags a number of compact resonant structures with different polarization attributes such as single polarized dual polarized and polarization insensitive have been proposed. A chipless RFID tag reader is also developed to read the designed tags in a laboratory setting. Successful reading of the designed tags using the developed reader has been accomplished for both mono static and bi static tag reading arrangements. The developed chipless RFID system finds potential applications in authentications of Australian polymer banknote and secured documents tagging of goods and consumables products bus tickets stamps and pharmaceuticals.
