Kochenderfer, Tim A. Wheeler, 2019-03-12 A comprehensive introduction to optimization with a focus on practical algorithms for the design of engineering systems This book offers a comprehensive introduction to optimization with a focus on practical algorithms The book approaches optimization from an engineering perspective where the objective is to design a system that optimizes a set of metrics subject to constraints Readers will learn about computational approaches for a range of challenges including searching high dimensional spaces handling problems where there are multiple competing objectives and accommodating uncertainty in the metrics Figures examples and exercises convey the intuition behind the mathematical approaches The text provides concrete implementations in the Julia programming language Topics covered include derivatives and their generalization to multiple dimensions local descent and first and second order methods that inform local descent stochastic methods which introduce randomness into the optimization process linear constrained optimization when both the objective function and the constraints are linear surrogate models probabilistic surrogate models and using probabilistic surrogate models to guide optimization optimization under uncertainty uncertainty propagation expression optimization and multidisciplinary design optimization Appendixes offer an introduction to the Julia language test functions for evaluating algorithm performance and mathematical concepts used in the derivation and analysis of the optimization methods discussed in the text The book can be used by advanced undergraduates and graduate students in mathematics statistics computer science any engineering field including electrical engineering and aerospace engineering and operations research and as a reference for professionals **Model Predictive Control System Design and Implementation Using**

MATLAB® Liuping Wang, 2009-02-14 Model Predictive Control System Design and Implementation Using MATLAB proposes methods for design and implementation of MPC systems using basis functions that confer the following advantages continuous and discrete time MPC problems solved in similar design frameworks a parsimonious parametric representation of the control trajectory gives rise to computationally efficient algorithms and better on line performance and a more general

discrete time representation of MPC design that becomes identical to the traditional approach for an appropriate choice of parameters After the theoretical presentation coverage is given to three industrial applications The subject of quadratic programming often associated with the core optimization algorithms of MPC is also introduced and explained The technical contents of this book is mainly based on advances in MPC using state space models and basis functions This volume includes numerous analytical examples and problems and MATLAB programs and exercises
