Sustainable Energy from Salinity Gradients Andrea Cipollina, Giorgio Micale, 2016-03-01 Salinity gradient energy also known as blue energy and osmotic energy is the energy obtainable from the difference in salt concentration between two feed solutions typically sea water and river water It is a large scale renewable resource that can be harvested and converted to electricity Efficient extraction of this energy is not straightforward however Sustainable Energy from Salinity Gradients provides a comprehensive review of resources technologies and applications in this area of fast growing interest Key technologies covered include pressure retarded osmosis reverse electrodialysis and accumulator mixing Environmental and economic aspects are also considered together with the possible synergies between desalination and salinity gradient energy technologies Sustainable Energy from Salinity Gradients is an essential text for R D professionals in the energy water industry interested in salinity gradient power and researchers in academia from post graduate level upwards For more than ten years the Editors have been sharing substantial research activities in the fields of renewable energy and desalination successfully participating to a number of European Union research projects and contributing to the relevant scientific literature with more than 100 papers and 2 books on Desalination technologies and their coupling with Renewable Energy They are intensely working in the field of Salinity Gradient Power carrying out research with specific focus on open loop and closed loop reverse electrodialysis and pressure retarded osmosis Covers applications of pressure retarded osmosis reverse electrodialysis and capacitive mixing for salinity gradient power in one convenient volume Presents the environmental aspects and economics of salinity gradient energy Explores possible synergies between desalination and salinity gradient energy

Polymer Solutions H. Fujita, 2012-12-02 Remarkable progress has been made in the last two decades in the study of concentrated polymer solutions leading to many new concepts theories and techniques in the field of polymer science Any description of the theory of polymer solutions is now insufficient unless both concentrated and dilute solutions are given equal attention This book reviews recent developments in the study of dilute and concentrated polymer solutions emphasizing mainly the typical equilibrium and steady state dynamic properties of linear homopolymers The author strives to clarify the gap which still remains open between current theories and well documented experimental results thereby stimulating further efforts toward a more accurate understanding of polymer solutions The book contains a collection of typical experimental data and their comparison with current theories molecular or phenomenological a summary of recent advances in the physics of concentrated polymer solutions and melts and an elementary account of the renormalization group theory as applied to dilute solutions Polymer Solutions should prove invaluable as a reference work for graduate students and specialists in this field

Principles and Models of Biological Transport Morton H. Friedman, 2008-12-15 Focus Organization and Content This book like the first edition deals with the mass transport processes that take place in living systems with a focus on the normal behavior of eukaryotic cells and the organisms they constitute in their normal physiological environment As a consequence of this focus the structure and content of the book differ from those of traditional transport texts We do not start with the engineering principles of mass transport which are well presented elsewhere and then seek biological applications of these principles rather we begin with the biological processes themselves and then develop the models and analytical tools that are needed to describe them This approach has several consequences First of all it drives the content of the text in a direction distinctively different from conventional transport texts This is cause the tools and models needed to describe complex

biological processes are often different from those employed to describe more well characterized inanimate systems Many biological processes must still be described phenomenologically using methodologies like nonequilibrium thermodynamics Simple electrical analogs employing a paucity of parameters can be more useful for characterization and prediction than complex theories based on the behavior of more well defined systems on a laboratory bench By allowing the biology to drive the choice of analysis tools and models the latter are consistently presented in the context of real biological systems and analysis and biology are interwoven throughout
