**Guidance for Good Bridge Design** fib Fédération internationale du béton, 2000-01-01 Addressed to designers and even more so to owners and project managers this part is meant as a guide to an efficient selection of designers and contractors and to the preparation of fair contracts providing high quality at reasonable cost Clearly a good design must be paid for at its real cost economising on the design cost can be extremely counterproductive for the owner when considering the final whole life cost of the project In addition it was considered very important to address the designer s responsibilities and relations with other participants in large projects and finally design philosophy itself Part 2 Design and construction aspects This more technical part is mainly addressed to bridge designers and devoted to a systematic analysis of structural and constructional bridge concepts Considering the importance of erection techniques in the development of bridge design this second part of the guide starts by a description of the different construction methods their advantages and draw backs their particularities and of course by defining the domain of their most efficient applications Another main chapter is devoted to the proper design of cross sections And finally a third main chapter deals in detail with the influence of construction techniques on design

**Steel-concrete Composite Bridges** David Collings, 2005 Steel concrete composite bridges shows how to choose the bridge form and design element sizes to enable the production of accurate drawings and also highlights a wide and full range of examples of the design and construction of this bridge type Jacket

Guidelines for the Design of Footbridges fib Fédération internationale du béton, 2005-01-01 The intention of fib Bulletin 32 is to present guidelines for the design of footbridges as well as bridges accommodating cyclists and bridleways equestrian paths The need for these guidelines comes from the fact that structural engineers designing footbridges currently have to spend considerable time and energy collecting information from numerous documents codes and recommendations to make design decisions There seems to be no international document dedicated solely to the design of footbridges These guidelines attempt to provide a concentrated source of information regarding all

design issues specific to footbridges It is meant to be a liberal document in the sense that it promotes new innovative and bold yet prudent designs by sharing the experience of the authors summarizing specifications given in codes and presenting a collection of examples of well designed structures or structural details from around the world It is not intended to be an international code that specifies limits and admissible values thus encouraging timid conservative designs that are repetitions of approved and tested designs Indeed it may be the very fact that no international code exists specifically for footbridges that encourages the wide variety of footbridge designs found today It should be noted that numerous guidelines codes and books have been published on bridge design in general Information given in those publications that is also applicable to footbridges is not repeated in Bulletin 32 The chapters of these guidelines all follow the same pattern an introduction to the subject general guidelines as well as do s and don t s a summary of information found in existing international codes recommendations experience of the authors and built examples with comparison and comments on this information examples Plenty of illustrations and photographs help to visualize the themes of this work The last chapter Case Studies contains footbridges each with a short summary of main structural data and references for further reading

*Design of Prestressed Concrete to Eurocode 2, Second Edition* Raymond Ian Gilbert, Neil Colin Mickleborough, Gianluca Ranzi, 2017-01-27 The design of structures in general and prestressed concrete structures in particular requires considerably more information than is contained in building codes A sound understanding of structural behaviour at all stages of loading is essential This textbook presents a detailed description and explanation of the behaviour of prestressed concrete members and structures both at service loads and at ultimate loads and in doing so provide a comprehensive and up to date guide to structural design Much of the text is based on first principles and relies only on the principles of mechanics and the properties of concrete and steel with numerous worked examples However where the design requirements are code specific this book refers to the provisions of Eurocode 2 Design of Concrete Structures and where possible the notation is the same as in Eurocode 2 A parallel volume is written to the Australian Standard for Concrete Structures AS3600 2009 The text runs from an introduction to the fundamentals to in depth treatments of more advanced topics in modern prestressed concrete structures It suits senior undergraduate and graduate students and also practising engineers who want comprehensive introduction to the design of prestressed concrete structures It retains the clear and concise explanations and the easy to read style of the first edition but the content has been extensively re organised and considerably expanded and updated New chapters cover design procedures actions and loads prestressing systems and construction requirements connections and detailing and design concepts for prestressed concrete bridges The topic of serviceability is developed extensively throughout All the authors have been researching and teaching the behaviour and design of prestressed concrete structures for over thirty five years and the proposed new edition of the book reflects this wealth of experience The work has also gained much from Professor Gilbert active and long time involvement in the development of standards for concrete buildings
