Kingsbury,2012-12-06 What justifies the size of this compendium of reviews on the paramyxoviruses As intracellular parasites that reproduce with almost complete indifference to nuclear activities paramyxoviruses have not been providing insights about genes that regulate cellular activities and development topics that account for much of the excitement in modern biology For contributions of virus research to those topics we must look to the retroviruses which have the propensity to steal developmentally important genes and subvert them to malignant purposes and to the nuclear DNA viruses whose gene expression depends heavily upon cellular transcription machinery making them exceptionally useful tools for identifying and characterizing components of that machinery From this perspective it may appear that purely lytic viruses like the paramyxoviruses are sitting on the sidelines of contemporary biology But there is plenty of action on the sidelines Paramyxoviruses remain unconquered devastating agents of disease Human deaths attributable to paramyxoviruses worldwide especially in children are numbered in the millions annually There are many pathogenic paramyxoviruses and too few effective vaccines and those vaccines against measles and mumps are affordable only by relatively affluent nations Moreover the paramyxoviruses are intrinsically interesting organisms presenting the challenge of understanding the self replication of RNA and many other challenges peculiar to the structures and functions of their proteins not only as individual entities but also as they act in concert during virus reproduction and interact with vital functions of the cells they infect and often but not always destroy

Superconducting Magnet Systems H. Brechna,2011-12-15 The renaissance of magnet technology started in the early 1950s with the establishment of high energy accelerators About a decade later in 1961 or fifty years after the discovery of superconductivity high field superconducting laboratory magnets became a reality Conventional still the major beam handling and experimen electromagnets which are tal devices used in laboratories operate at zero efficiency To generate high magnetic fields in a useful volume considerable amounts of power are needed Superconducting d c magnets do not require any power at all It is somewhat depressing to note that sixty years after the first superconductor was tested the experimental d c superconducting mag net is still the only large scale equipment operated in laboratories Al though there has been considerable activity in the area of superconduc tivity superconductors are used on quite a modest scale in electronic and quantum devices in medicine and biology and in physical experi ments where high magnetic fields are essential It is only recently that Type II superconductors have been introduced in power engineering power generation storage and transport to replace pulsed accelerator magnets for fast and economical transportation vehicles levitated trains where superconductors may ultimately replace the wheel to make new means of en rgy generation economically feasible such as in magneto hydrodynamics and in fusion reactors and for high efficiency electric motors High field superconducting magnets are being proposed for de salination of seawater for magnetic separation in the mining industry for cleaning polluted water and for sewage treatment
