

01. About Me

Hello! My name is Brittany and I enjoy creating things that live on the internet. My interest in web development started back in 2012 when I decided to try editing custom Tumblr themes — turns out hacking together a custom reblog button taught me a lot about HTML & CSS!

Fast-forward to today, and I've had the privilege of working at **an advertising agency**, **a start-up**, **a huge corporation**, and **a student-led design studio**. My main focus these days is building accessible, inclusive products and digital experiences at **Upstatement** for a variety of clients.

I also recently **launched a course** that covers everything you need to build a web app with the Spotify API using Node & React.

Here are a few technologies I've been working with recently:

- JavaScript (ES6+)
- TypeScript
- React
- jQuery
- Node.js
- WordPress

today's corporations get to stay innovative reinvent themselves continuously and have to design new business. In contrast to that software mastery becomes more than ever the key factor for business success Northrop 2008 p 12. In the twenty first century software pervades every sector and has become the bottom line for many organisations. Therefore reusability plays a growing role for every business in today's rapid changing world Strahringer 2003 p 5. Thus new paradigms in software engineering are focusing on the reutilisation and modularisation of software solutions. One innovative and growing concept since 2003 is software line development which has its origin in the automotive and fashion industry Strahringer 2003 p 5. The key benefits of software line development is the covering of a wide field of application with minimal extra costs by reuse of a common software platform. In reference to Ebert Smouts 2003 p 29 the most publications in the field of software lines deal with configuration and change management. Whereas the integration of software line development into enterprises product portfolios has been till now widely neglected. In contrast to that Jeffery Leliveld 2004 points out that the failure or success of software lines highly depend in particular on their level of integration into companies portfolio system. For this reason the major goal of this research is the realisation of an integrated portfolio management system for software line development. This covers at first the determination of the role portfolio management in organisational governance. Thereafter the general elements of a portfolio management system will be identified. On the other side the specific demands of software line engineering according to the portfolio elements will be analysed. The insights of the analysis build the basis for the design of the software product line portfolio system. The design describes the portfolio system from different perspectives which represent the viewpoint of diverse stakeholders. Moreover different analysis methods will be evaluated with a respective scoring model for the software line product domain and asset application domain. At the end the scientific work gives a suggestion for further investigations in the scope of software line portfolio management.

Experimentation in Software Engineering Claes Wohlin, Per Runeson, Martin Höst, Magnus C. Ohlsson, Björn Regnell, Anders Wesslén, 2012-06-16. Like other sciences and engineering disciplines software engineering requires a cycle of model building experimentation and learning. Experiments are valuable tools for all software engineers who are involved in evaluating and choosing between different methods techniques languages and tools. The purpose of Experimentation in Software Engineering is to introduce students teachers researchers and practitioners to empirical studies in software engineering using controlled experiments. The introduction to experimentation is provided through a process perspective and the focus is on the steps that we have to go through to perform an experiment. The book is divided into three parts. The first part provides a background of theories and methods used in experimentation. Part II then devotes one chapter to each of the five experiment steps scoping planning execution analysis and result presentation. Part III completes the presentation with two examples. Assignments and statistical material are provided in appendixes. Overall the book provides indispensable information regarding empirical studies in particular for experiments but also for case studies systematic literature reviews and surveys. It is a revision of the authors

book which was published in 2000 In addition substantial new material e g concerning systematic literature reviews and case study research is introduced The book is self contained and it is suitable as a course book in undergraduate or graduate studies where the need for empirical studies in software engineering is stressed Exercises and assignments are included to combine the more theoretical material with practical aspects Researchers will also benefit from the book learning more about how to conduct empirical studies and likewise practitioners may use it as a cookbook when evaluating new methods or techniques before implementing them in their organization
