Cooperative and Noncooperative Multi-Level Programming Masatoshi Sakawa, Ichiro Nishizaki, 2009-07-01 To derive rational and convincing solutions to practical decision making problems in complex and hierarchical human organizations the decision making problems are formulated as relevant mathematical programming problems which are solved by developing optimization techniques so as to exploit characteristics or structural features of the formulated problems In particular for resolving conflict in decision making in hierarchical managerial or public organizations the multi level formulation of the mathematical programming problems has been often employed together with the solution concept of Stackelberg equilibrium However we conceive that a pair of the conventional formulation and the solution concept is not always sufficient to cope with a large variety of decision making situations in actual hierarchical organizations The following issues should be taken into consideration in expression and formulation of decision making problems In formulation of mathematical programming problems it is tacitly supposed that decisions are made by a single person while game theory deals with economic behavior of multiple decision makers with fully rational judgment Because two level mathematical programming problems are interpreted as static Stackelberg games multi level mathematical programming is relevant to noncooperative game theory in conventional multi level mathematical programming models employing the solution concept of Stackelberg equilibrium it is assumed that there is no communication among decision makers or they do not make any binding agreement even if there exists such communication However for decision making problems in such as decentralized large firms with divisional independence it is quite natural to suppose that there exists communication and some cooperative relationship among the decision makers
