*Proofs and Fundamentals* Ethan D. Bloch, 2013-12-01 The aim of this book is to help students write mathematics better Throughout it are large exercise sets well integrated with the text and varying appropriately from easy to hard Basic issues are treated and attention is given to small issues like not placing a mathematical symbol directly after a punctuation mark And it provides many examples of what students should think and what they should write and how these two are often not the same

*The Elements of Statistical Learning* Trevor Hastie, Robert Tibshirani, Jerome Friedman, 2013-11-11 During the past decade there has been an explosion in computation and information technology. With it have come vast amounts of data in a variety of fields such as medicine, biology, finance, and marketing. The challenge of understanding these data has led to the development of new tools in the field of statistics and spawned new areas such as data mining, machine learning, and bioinformatics. Many of these tools have common underpinnings but are often expressed with different terminology. This book describes the important ideas in these areas in a common conceptual framework. While the approach is statistical, the emphasis is on concepts rather than mathematics. Many examples are given with a liberal use of color graphics. It should be a valuable resource for statisticians and anyone interested in data mining in science or industry. The book's coverage is broad, from supervised learning (prediction) to unsupervised learning. The many topics include neural networks, support vector machines, classification trees, and boosting (the first comprehensive treatment of this topic in any book). This major new edition features many topics not covered in the original, including graphical models, random forests, ensemble methods, least-angle regression, path algorithms for the lasso, non-negative matrix factorization, and spectral clustering. There is also a chapter on methods for wide data ( $p$  bigger than  $n$ ) including multiple testing and false discovery rates. Trevor Hastie, Robert Tibshirani, and Jerome Friedman are professors of statistics at Stanford University. They are prominent researchers in this area. Hastie and Tibshirani developed generalized additive models and wrote a popular book of that title. Hastie co-developed much of the statistical modeling software and environment in R, S-PLUS, and invented principal curves and surfaces. Tibshirani proposed the lasso and is co-author of the very successful *An Introduction to the Bootstrap*. Friedman is the co-inventor of many data mining tools including CART, MARS, projection pursuit, and gradient boosting.
