Regulation of Tissue Oxygenation, Second Edition Roland N. Pittman, 2016-08-18 This presentation describes various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate ATP the energy currency of all cells The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4.5 mm Hg Thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂ In order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved

Human Performance Modification National Research Council, Division of Behavioral and Social Sciences and Education, Board on Behavioral, Cognitive, and Sensory Sciences, Division on Engineering and Physical Sciences, Committee on Assessing Foreign Technology Development in Human Performance Modification, 2012-11-19 The development of technologies to modify natural human physical and cognitive performance is one of increasing interest and concern especially among military services that may be called on to defeat foreign powers with enhanced warfighter capabilities Human performance modification HPM is a general term that can encompass actions ranging from the use of natural materials such as caffeine or khat as a stimulant to the application of nanotechnology as a drug delivery mechanism or in an invasive brain implant Although the literature on HPM typically addresses methods that enhance performance another possible focus is methods that degrade performance or negatively affect a military force's ability to fight Advances in medicine biology electronics and computation have enabled an increasingly sophisticated ability to modify the human body and such innovations will undoubtedly be adopted by military forces with potential consequences for both sides of the battle lines Although some innovations may be developed for purely military applications they are increasingly unlikely to remain exclusively in that sphere because of the globalization and internationalization of the commercial research base Based on its review of the literature the presentations it received and on its own expertise the Committee on Assessing Foreign Technology Development in Human Performance Modification chose to focus on three general areas of HPM human cognitive modification as a computational problem human performance modification as a biological problem and human performance modification as a function of the brain computer interface *Human Performance Modification Review of Worldwide Research with a View to the Future* summarizes these findings
