Biodiversity and Chemotaxonomy Kishan Gopal Ramawat, 2019-11-10 Plant classifications are based on morphological characters and it is difficult particularly in small plants and grasses to identify these below generic level on the basis of these characters using a dissecting microscope Plant species have intra and inter specific variation in secondary metabolites which can be utilized as marker compounds for identification and classification of plants Secondary metabolites are produced as a result of primary metabolism and the production of these compounds not only involves several genes but also it is an energy dependent process Hence these products cannot be considered as insignificant for the plant and the environment Modern tools of molecular biology and secondary metabolites present in them can definitively decide about classification of plants Absence of correct identification of plant is associated to many problems of resource utilization Due to wide availability of these tools interest has revived in systematics and correct classification of plants based on these parameters for their sustainable utilization and resource management The purpose of this book is to assess the potential of phytochemical and molecular tools in the systematic and classification of plants The topics covered include species concept barcoding and phylogenetic analysis chemotaxonomy use of polyketides carotenes cuticular wax volatile oils biodiversity of corals metazoans *Ruta* and *Echinocereus* It provides comprehensive and broad subject based reviews useful for students teachers researchers and all others interested in the field The field has been kept wide and general to accommodate the wide ranging topics This book will be useful to agriculturists chemists botanists industrialists and those involved in planning of crop plants

Coumarin and Its Derivatives Maria João Matos, 2021-12-29 Coumarins are widely distributed in nature and can be found in a large number of naturally occurring and synthetic bioactive molecules. The unique and versatile oxygen-containing heterocyclic structure makes them a privileged scaffold in Medicinal Chemistry. Many coumarin derivatives have been extracted from natural sources, designed, synthesized, and evaluated on different pharmacological targets. In addition, coumarin-based ion receptors, fluorescent probes, and biological stains are growing quickly and have extensive applications to monitor timely enzyme activity, complex biological events, as well as accurate pharmacological and pharmacokinetic properties in living cells. The extraction, synthesis, and biological evaluation of coumarins have become extremely attractive and rapidly developing topics. A large number of research and review papers have compiled information on this important family of compounds. In 2020, research articles, reviews, communications, and concept papers focused on the multidisciplinary profile of coumarins, highlighting natural sources, most recent synthetic pathways, along with the main biological applications and theoretical studies, were the main focus of this book. The huge and growing range of applications of coumarins described in this book is a demonstration of the potential of this family of compounds in Organic Chemistry, Medicinal Chemistry, and different sciences related to the study of natural products. This book includes 23 articles, 17 original papers, and six review papers.

Modern Methods of Drug Discovery Alexander Hillisch, Rolf Hilgenfeld, 2012-11-28 Research in the pharmaceutical industry today is in many respects quite different from what it used to be only fifteen years ago. There have been dramatic changes in approaches for identifying new chemical entities with a desired biological activity. While chemical modification of existing leads was the most important approach in the 1970s and 1980s, high-throughput screening and structure-based design are now major players among a multitude of methods used in drug discovery. Quite often, companies favor one of these relatively new approaches over the other, e.g., screening over rational design or vice versa, but we believe that an intelligent and concerted use of several or all methods currently available to drug discovery will be more successful in the medium term. What has changed most significantly in the past few years is the time available for identifying new chemical entities. Because of the high costs of drug discovery projects, pressure for maximum success in the shortest possible time is higher than ever. In addition, the multidisciplinary character of the field is much more pronounced today than it used to be. As a consequence, researchers and project managers in the pharmaceutical industry should have a solid knowledge of the more important methods available to drug discovery because it is the rapidly and intelligently combined use of these which will determine the success or failure of preclinical projects.

Some Chemicals Present in Industrial and Consumer Products, Food and Drinking-water IARC Working Group on the Evaluation of Carcinogenic Risks to Humans, International Agency for Research on Cancer, 2013 This volume of the IARC Monographs provides an assessment of the carcinogenicity of 18 chemicals present in industrial and consumer products or food, natural constituents, contaminants, or flavorings, or occurring as water chlorination by-products. The compounds evaluated include the widely used plasticizer di(2-ethylhexyl) phthalate and the food contaminant 4-methylimidazole. In view of the limited agent-specific information available from epidemiological studies, the IARC Monographs Working Group relied mainly on carcinogenicity bioassays and mechanistic and other relevant data to evaluate the carcinogenic hazards to humans exposed to these agents.
