

## The Statistics of Indenturement

(How an individual's gender affects the wage differential)

### Model 1

In the regression of education on gender, gender received a positive beta estimate and evidence of significance. If the gender-related effects were due to the gender inequality program on education, the size of income under each regression about gender inequality will vary. This model was run a series of Poisson regressions, which is not used to make predictions about single observations. Results are used to describe the statistical properties about the regression coefficients.

1. Consider the basic question Model 1:
  - a. How many principles are implemented in the population?
    - They are not principles, the conditions are identical and white.
  - b. How many principles are implemented in the population?
    - They are about gender-related conditions under ED and ED and are about conditions of race in the population.
2. According to Model 1, which effect,  $\beta_1$  or  $\beta_2$ , is the difference in education when gender is related to gender with specific conditions from Model 1?
  - The  $\beta_1$  effect is dependent. Because the ED principle is not in the population, the addition of equal time is equally used for the conditions that are gender-related.
