Engineering Rules JoAnne Yates, Craig N. Murphy, 2019-06-11 The first global history of voluntary consensus standard setting Finalist Hagley Prize in Business History The Hagley Museum and Library The Business History Conference Private voluntary standards shape almost everything we use from screw threads to shipping containers to e readers They have been critical to every major change in the world economy for more than a century including the rise of global manufacturing and the ubiquity of the internet In *Engineering Rules* JoAnne Yates and Craig N Murphy trace the standard setting system s evolution through time revealing a process with an astonishingly pervasive if rarely noticed impact on all of our lives This type of standard setting was established in the 1880s when engineers aimed to prove their status as professionals by creating useful standards that would be widely adopted by manufacturers while satisfying corporate customers Yates and Murphy explain how these engineers processes provided a timely way to set desirable standards that would have taken much longer to emerge from the market and that governments were rarely willing to set By the 1920s the standardizers began to think of themselves as critical to global prosperity and world peace After World War II standardizers transcended Cold War divisions to create standards that made the global economy possible Finally Yates and Murphy reveal how since 1990 a new generation of standardizers has focused on supporting the internet and web while applying the same standard setting process to regulate the potential social and environmental harms of the increasingly global economy Drawing on archival materials from three continents Yates and Murphy describe the positive ideals that sparked the standardization movement the ways its leaders tried to realize those ideals and the challenges the movement faces today *Engineering Rules* is a riveting global history of the people processes and organizations that created and maintain this nearly invisible infrastructure of today s economy which is just as important as the state or the global market

Carbon Queen Maia Weinstock, 2022-03-01 The life of trailblazing physicist Mildred Dresselhaus who expanded our understanding of the physical world As a girl in New York City in the 1940s Mildred Millie Dresselhaus was taught that there were only three career options open to women secretary nurse or teacher But sneaking into museums purchasing three cent copies of *National Geographic* and devouring books on the history of science ignited in Dresselhaus 1930 2017 a passion for inquiry In *Carbon Queen* science writer Maia Weinstock describes how with curiosity and drive Dresselhaus defied expectations and forged a career as a pioneering scientist and engineer Dresselhaus made highly influential discoveries about the properties of carbon and other materials and helped reshape our world in countless ways from electronics to aviation to medicine to energy She was also a trailblazer for women in STEM and a beloved educator mentor and colleague Her path wasn t easy Dresselhaus s Bronx childhood was impoverished Her graduate adviser felt educating women was a waste of time But

Dresselhaus persisted finding mentors in Nobel Prize winning physicists Rosalyn Yalow and Enrico Fermi Eventually Dresselhaus became one of the first female professors at MIT where she would spend nearly six decades Weinstock explores the basics of Dresselhaus's work in carbon nanoscience accessibly and engagingly describing how she identified key properties of carbon forms including graphite buckyballs nanotubes and graphene leading to applications that range from lighter stronger aircraft to more energy efficient and flexible electronics

The Age of Living Machines: How Biology Will Build the Next Technology Revolution Susan Hockfield, 2019-05-07 From the former president of MIT the story of the next technology revolution and how it will change our lives A century ago discoveries in physics came together with engineering to produce an array of astonishing new technologies radios telephones televisions aircraft radar nuclear power computers the Internet and a host of still evolving digital tools These technologies so radically reshaped our world that we can no longer conceive of life without them Today the world's population is projected to rise to well over 9.5 billion by 2050 and we are currently faced with the consequences of producing the energy that fuels heats and cools us With temperatures and sea levels rising and large portions of the globe plagued with drought famine and drug resistant diseases we need new technologies to tackle these problems But we are on the cusp of a new convergence argues world renowned neuroscientist Susan Hockfield with discoveries in biology coming together with engineering to produce another array of almost inconceivable technologies next generation products that have the potential to be every bit as paradigm shifting as the twentieth century's digital wonders The Age of Living Machines describes some of the most exciting new developments and the scientists and engineers who helped create them Virus built batteries Protein based water filters Cancer detecting nanoparticles Mind reading bionic limbs Computer engineered crops Together they highlight the promise of the technology revolution of the twenty first century to overcome some of the greatest humanitarian medical and environmental challenges of our time

Modeling and Approximation in Heat Transfer Leon R. Glicksman, John H. Lienhard, 2016-08-30 This book describes the approach to engineering solutions through simplified modeling of important physical features and approximating their behavior Students will have greater facility in breaking down complex engineering systems into simplified thermal models that allow essential features of their performance to be assessed and modified

Learning to Communicate in Science and Engineering Mya Poe, Neal Lerner, Jennifer Craig, 2010-02-05 Case studies and pedagogical strategies to help science and engineering students improve their writing and speaking skills while developing professional identities To many science and engineering students the task of writing may seem irrelevant to their future professional careers At MIT however students discover that writing about their technical work is important not only in solving real world problems but also in developing their professional identities MIT puts into practice the belief that engineers who don't write well end up working for engineers who do write well requiring all students to take communications intensive classes in which they learn from MIT faculty and writing instructors how to express their ideas in writing and in presentations Students are

challenged not only to think like professional scientists and engineers but also to communicate like them This book offers in depth case studies and pedagogical strategies from a range of science and engineering communication intensive classes at MIT It traces the progress of seventeen students from diverse backgrounds in seven classes that span five departments Undergraduates in biology attempt to turn scientific findings into a research article graduate students learn to define their research for scientific grant writing undergraduates in biomedical engineering learn to use data as evidence and students in aeronautic and astronautic engineering learn to communicate collaboratively Each case study is introduced by a description of its theoretical and curricular context and an outline of the objectives for the students activities The studies describe the on the ground realities of working with faculty staff and students to achieve communication and course goals offering lessons that can be easily applied to a wide variety of settings and institutions

The M.I.T. Engineering Practice School at Oak Ridge for Graduate Studies in Science and Engineering Massachusetts Institute of Technology. Engineering Practice School,Raymond F. Baddour,Allan S. Hoffman,1955 *Technology Review* ,1908 *The Strategic Management of Large Engineering Projects* Roger Miller,Donald R. Lessard,2001-03-12 The book is based on an international research project that analyzed sixty LEPs among them the Boston Harbor cleanup the first phase of subway construction in Ankara Turkey a hydro

dam on the Caroni River in Venezuela and the construction of offshore oil platforms west of Flor Norway As the number complexity and scope of large engineering projects LEPs increase worldwide the huge stakes may endanger the survival of corporations and threaten the stability of countries that approach these projects unprepared According to the authors the front end engineering of institutional arrangements and strategic systems is a far greater determinant of an LEP s success than are the more tangible aspects of project engineering and management The book is based on an international research project that analyzed sixty LEPs among them the Boston Harbor cleanup the first phase of subway construction in Ankara Turkey a hydro dam on the Caroni River in Venezuela and the construction of offshore oil platforms west of Flor Norway The authors use the research results to develop an experience based theoretical framework that will allow managers to understand and respond to the complexity and uncertainty inherent in all LEPs In addition to managers and scholars of large scale projects the book will be of interest to those studying the relationship between institutions and strategy risk management and corporate governance in general Contributors Bjorn Andersen Richard Brealey Ian Cooper Serghei Floricel Michel Habib Brian Hobbs Donald R Lessard Pascale Michaud Roger Miller Xavier Olleros

ANNUAL REVIEW OF HEAT TRANSFER VOLUME XXII, ANNUAL VOLUME 2019 ,2021 *System Architecture* Edward Crawley, Bruce Cameron, Daniel Selva, 2016 For courses in engineering and technical management Architecture and Function of Complex Systems System architecture is the study of early decision making in complex systems This text teaches how to capture experience and analysis about early system decisions and how to choose architectures that meet stakeholder needs integrate easily and evolve flexibly With case studies written by leading practitioners from hybrid cars to communications networks to aircraft this text showcases the science and art of system architecture

Cellular Solids Lorna J. Gibson, Michael F. Ashby, 1997 In this new edition of their classic work on Cellular Solids the authors have brought the book completely up to date including new work on processing of metallic and ceramic foams and on the mechanical electrical and acoustic properties of cellular solids Data for commercially available foams are presented on material property charts two new case studies show how the charts are used for selection of foams in engineering design Over 150 references appearing in the literature since the publication of the first edition are cited The text summarises current understanding of the structure and mechanical behaviour of cellular materials and the ways in which they can be exploited in engineering design Cellular solids include engineering honeycombs and foams which can now be made from polymers metals ceramics and composites as well as natural materials such as wood cork and cancellous bone

From X-rays to DNA W. David Lee,Jeffrey Drazen,Phillip A. Sharp,Robert S. Langer,2014 An argument that technology accelerates biological discovery with case studies ranging from chromosome discovery with early microscopes to how DNA replicates using radioisotope labels Engineering has been an essential collaborator in biological research and breakthroughs in biology are often enabled by technological advances Decoding the double helix structure of DNA for example only became possible after significant advances in such technologies as X ray diffraction and gel electrophoresis Diagnosis and treatment of tuberculosis improved as new technologies including the stethoscope the microscope and the X ray developed These engineering breakthroughs take place away from the biology lab and many years may elapse before the technology becomes available to biologists In this book David Lee argues for concurrent engineering the convergence of engineering and

biological research as a means to accelerate the pace of biological discovery and its application to diagnosis and treatment He presents extensive case studies and introduces a metric to measure the time between technological development and biological discovery Investigating a series of major biological discoveries that range from pasteurization to electron microscopy Lee finds that it took an average of forty years for the necessary technology to become available for laboratory use Lee calls for new approaches to research and funding to encourage a tighter more collaborative coupling of engineering and biology Only then he argues will we see the rapid advances in the life sciences that are critically needed for life saving diagnosis and treatment

A Case for Climate Engineering David Keith, 2013-09-20 A leading scientist argues that we must consider deploying climate engineering technology to slow the pace of global warming Climate engineering which could slow the pace of global warming by injecting reflective particles into the upper atmosphere has emerged in recent years as an extremely controversial technology And for good reason it carries unknown risks and it may undermine commitments to conserving energy Some critics also view it as an immoral human breach of the natural world The latter objection David Keith argues in *A Scientist's Case for Climate Engineering* is groundless we have been using technology to alter our environment for years But he agrees that there are large issues at stake A leading scientist long concerned about climate change Keith offers no naive proposal for an easy fix to what is perhaps the most challenging question of our time climate engineering is no silver bullet But he argues that after decades during which very little progress has been made in reducing carbon emissions we must put this technology on the table and consider it responsibly That doesn't mean we will deploy it and it doesn't mean that we can abandon efforts to reduce greenhouse gas emissions But we must understand fully what research needs to be done and how the technology might be designed and used This book provides a clear and accessible overview of what the costs and risks might be and how climate engineering might fit into a larger program for managing climate change
