The HCR (Harvest Cost-Revenue) Estimator is engineering and financial analysis software used to evaluate stand-level financial thresholds for harvesting small diameter ponderosa pine (*Pinus ponderosa* Dougl. ex Laws.) in the Southwest United States. The Windows-based program helps contractors and planners to identify costs associated with tree selection, residual handling, transportation of raw materials, and equipment used. Costs are compared against total financial return for regionally based market opportunities to arrive at potential net profit. Information is used to identify per-acre cost thresholds, for contract appraisal, and for prioritizing project planning for wildfire fuel reduction treatments and forest restoration efforts. Guides to the FIDIC contract traditionally have been geared towards highlighting the legal aspects of claims arising from the contract. This text focuses on the practical administration of the contract recognizing the growing tendency for projects to be administered by local employers, consultants and contractors, rather than by international organizations.
