

Weather and Whooping Cranes

Pre-Lab Discussion

The whooping crane is a tall, white bird with red markings on its forehead and face. It is native to certain North American wetlands. In the twentieth century, the population of this magnificent bird has decreased almost to the point of disappearing. In 1941, only 14 cranes were living. Although more than ten times as many cranes are now living in the wild, they are still at risk. About half of the cranes live in the wild. Most breed in Wood Buffalo National Park in Canada and winter in Aransas National Wildlife Refuge in Texas.

Scientists, working to save the whooping cranes, investigated what abiotic factors affect the birds. In this investigation, you will analyze the data from one such study.

1. What do whooping cranes need to obtain from their habitat?

2. What abiotic factors might limit the population of whooping cranes?

Problem

How does precipitation affect the population of whooping cranes?

Materials (per group)

ruler
calculator
pencil

Procedure

1. Using Figure 1 and the data in Data Table 1, plot a graph showing how the crane population changed from year 1 to year 16 of the study. The crane population in any given year is the total number of migrating adults and hatched eggs. Answer Questions 1–3 in Observations.
2. Study the data in Data Table 1. Answer Questions 4–6 in Observations.
3. Using a calculator, determine the hatching success rate for each year.

$$\text{Hatching success rate} = \frac{\text{Number of eggs hatched}}{\text{Number of eggs laid}} \times 100\%$$

Write these values in the corresponding boxes in Data Table 2. Answer Question 7 in Observations.

Birds of Nebraska Roger S. Sharpe, W. Ross Silcock, Joel G. Jorgensen, 2001-01-01 Nebraska sits at the nexus of continental bird migration and serves as a home either permanently or seasonally for nearly 450 species. Major migratory routes pass through the state creating numerous opportunities to observe the great variety of North American bird species. The annual crane migrations in spring are legendary and other key events include winter concentrations of bald eagles, flocks of up to thirty thousand grebes, mergansers, and gulls at Lake McConaughy in late fall and incredible concentrations of waterfowl in the Rainwater Basin in early spring. *Birds of Nebraska* captures the variety of Nebraska's ornithological possibilities in a style useful to hobbyists and professionals alike. For the first time in Nebraska ornithology, the authors have provided an exhaustive summary of state bird records compiled into concise but readable accounts of all species of birds reported in the state. This work covers taxonomy, early and late migration dates, high counts, nesting areas, and likely viewing locations.

Ecology Charles J. Krebs, 2001 This best-selling major ecology book continues to present ecology as a series of problems for readers to critically analyze. No other text presents analytical, quantitative, and statistical ecological information in an equally accessible style. Reflecting the way ecologists actually practice, the book emphasizes the role of experiments in testing ecological ideas and discusses many contemporary and controversial problems related to distribution and abundance. Throughout the book, Krebs thoroughly explains the application of mathematical concepts in ecology while reinforcing these concepts with research references, examples, and interesting end-of-chapter review questions. Thoroughly updated with new examples and references, the book now features a new full-color design and is accompanied by an art CD-ROM for instructors. The field package also includes *The Ecology Action Guide*, a guide that encourages readers to be environmentally responsible citizens, and a subscription to *The Ecology Place* (www.ecologyplace.com), a web site and CD-ROM that enables users to become virtual field ecologists by performing experiments such as estimating the number of mice on an imaginary island or restoring prairie land in Iowa. For college instructors and students.

Endangered and Threatened Species of the Platte River National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Board on Environmental Studies and Toxicology, Committee on Endangered and Threatened Species in the Platte River Basin, 2005-02-24 The tension between wildlife protection under the Endangered Species Act and water management in the Platte River Basin has existed for more than 25 years. The Platte River provides important habitat for migratory and breeding birds, including three endangered or threatened species: the whooping crane, the northern Great Plains population of the piping plover, and the interior least tern. The leading factors attributed to the decline of the cranes are historical overhunting and widespread habitat destruction, and for the plovers and terns, human interference during nesting and the loss of riverine nesting sites in open sandy areas that have been replaced with woodlands, sand and gravel mines, housing, and roadways. Extensive damming has disrupted passage of the endangered pallid sturgeon and resulted in less suitable habitat conditions such as cooler stream flows, less turbid waters, and inconsistent flow regimes. Commercial harvesting, now illegal, also contributed to the decline of the sturgeon. *Endangered and Threatened Species of the Platte River* addresses the habitat requirements for these federally protected species. The book further examines the scientific aspects of the U.S. Fish and Wildlife Service's instream flow recommendations and habitat suitability guidelines and assesses the science concerning the connections among the physical systems of the river as they relate to species habitats.
