

Plate Tectonic Movements

Name: _____ Period: _____ Date: _____

EQ: How is Earth's crust changed by plate movements?

Plate Tectonics: Welcome to the greatest show on Earth. Propelled by intense heat simmering beneath the crust or the mantle, *Earth's surface is dramatically reshaping itself in an endless, slow-motion movement* called plate tectonics. Tectonic plates or huge slabs of solid rocks *separate, collide, and slide past each other* causing earthquakes, feeding volcanic eruptions, and raising mountains. Scientists now have a fairly good understanding of how the plates move and how such movements relate to earthquake activity. Most movement occurs along narrow zones between plates, **plate boundaries**, where the results of plate-tectonic forces are most evident.

Types of plate boundaries:

1. **Divergent boundaries** -- where new crust is generated as the plates **pull away or separates** from each other.
Examples: mid ocean ridge, rift valleys
2. **Convergent boundaries** -- where crust **come together**. One crust is destroyed as it dives under another, known as subduction.
Examples: subduction, Marianas trench, mountains, volcanoes
3. **Transform boundaries** -- where crust is neither produced nor destroyed as the plates **slide horizontally past each other**. Example: San Andreas fault

Plates Move Apart: Divergent Boundary

Atlantic ocean, along a global system of mountain ridges, Earth's plates are growing and spreading apart. Each year these oceanic spreading ridges erupt more than three times as much molten rock as do all the volcanoes on land. Magma rises from Earth's mantle at spreading ridges and cools on and beneath the ocean floor, adding to the plates on either side. The growing plates inch away from the ridges—widening ocean basins and rafting apart entire continents.

Plates Come Together: Convergent Boundary

Where plates come together, or converge, we see some dramatic manifestations of plate tectonics. At convergent margins, continents grow as plates are consumed.

Three types of Convergent Boundaries

1. Convergent boundary between **continental and oceanic crust** results to subduction, volcanoes, and trenches.
2. Convergent boundary between **two oceanic crust** results to subduction, and the trenches formed are deeper like the Marianas Trench, which can sink Mt. Everest.
3. Convergent boundary between **two continental crust** results to building up the rocks forming mountains like the Appalachian and Himalayas mountain ranges.

This Dynamic Earth W. Jacquelyne Kious, Robert I. Tilling, Geological Survey (U.S.), 1996 In the early 1960s the emergence of the theory of plate tectonics started a revolution in the earth sciences Since then scientists have verified and refined this theory and now have a much better understanding of how our planet has been shaped by plate tectonic processes We now know that directly or indirectly plate tectonics influences nearly all geologic processes past and present Indeed the notion that the entire Earth s surface is continually shifting has profoundly changed the way we view our world

Environmental Science Tracey Greenwood, Kent Pryor, Lisa Bainbridge-Smith, Richard Allan, 2013 Environmental Science introduces students to the Earth's physical and biological systems and the interactions of humans with these. This revision introduces new content and aligns the workbook to its supporting digital resources. Content developments include updates on the Gulf of Mexico oil spill and the Fukushima Daiichi nuclear disaster and in-depth coverage of energy extraction, issues of pollution, and the wider environmental implications of urban development. The ideal companion to both the APES curriculum and the IB Environmental Systems and Societies Back cover.

Fundamentals of Geomorphology Richard John Huggett, 2011-03-15 This extensively revised, restructured, and updated edition continues to present an engaging and comprehensive introduction to the subject, exploring the world's landforms from a broad systems perspective. It covers the basics of Earth surface forms and processes while reflecting on the latest developments in the field. Fundamentals of Geomorphology begins with a consideration of the nature of geomorphology: process and form, history, and geomorphic systems, and moves on to discuss structure: structural landforms associated with plate tectonics and those associated with volcanoes, impact craters, and folds, faults, and joints; process and form: landforms resulting from or influenced by the exogenic agencies of weathering, running water, flowing ice, and meltwater, ground ice, and frost, the wind, and the sea; landforms developed on limestone, and landscape evolution: a discussion of ancient landforms, including palaeosurfaces, stagnant landscape features, and evolutionary aspects of landscape change. This third edition has been fully updated to include a clearer initial explanation of the nature of geomorphology of land surface process and form, and of land surface change over different timescales. The text has been restructured to incorporate information on geomorphic materials and processes at more suitable points in the book. Finally, historical geomorphology has been integrated throughout the text to reflect the importance of history in all aspects of geomorphology. Fundamentals of Geomorphology provides a stimulating and innovative perspective on the key topics and debates within the field of geomorphology. Written in an accessible and lively manner, it includes guides to further reading, chapter summaries, and an extensive glossary of key terms. The book is also illustrated throughout with over 200 informative diagrams and attractive photographs, all in colour.
