Physician adoption of electronic medical records (EMRs) has become a national priority. It is said that EMRs have the potential to greatly improve patient care, to provide the data needed for more effective population management and quality assurance of both an individual practice's patients and well as patients of large health care systems, and the potential to create efficiencies that allow physicians to provide this improved care at a far lower cost than at present. There is currently a strong U.S. government push for physicians to adopt EMR technology, with the Obama administration emphasizing the use of EMRs as an important part of the future of health care and urging widespread adoption of this technology by 2014. This timely book for the primary care community offers a concise and easy to read guide for implementing an EMR system. Organized in six sections, this invaluable title details the general state of the EMR landscape, covering the government's incentive program, promises and pitfalls of EMR technology, issues related to standardization and the range of EMR vendors from which a provider can choose. Importantly, chapter two provides a detailed and highly instructional account of the experiences that a range of primary care providers have had in implementing EMR systems. Chapter three discusses how to effectively choose an EMR system, while chapters four and five cover all of the vital pre-implementation and implementation issues in establishing an EMR system in the primary care environment. Finally, chapter six discusses how to optimize and maintain a new EMR system to achieve the full cost savings desired. Concise, direct, but above all honest in recognizing the challenges in choosing and implementing an electronic health record in primary care, *Electronic Medical Records: A Practical Guide for Primary Care* has been written with the busy primary care physician in mind. This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews. Emergency medical service providers serve as the primary immediate response to emergencies of all kinds, including natural disasters and acts of terrorism in the United States, with states serving as the regulatory agencies responsible for training, scope of practice, and continuing education for potential and working EMS providers. This text serves as a comprehensive guide to individuals in training to become emergency medical service providers and complements Emergency Medical Technician (EMT) and Emergency Medical Responder (EMR) courses as the primary classroom text consistent with National EMS Curriculum Standards and other industry guidelines. View a Recorded Webinar Demonstration <http://go.jblearning.com/EHRdemo> Jones & Bartlett Learning is proud to offer Simulated Health Records Simplified, the EHR Learning Portal created and hosted by DataWeb Inc. It is a cloud-based EHR (Electronic Health Record) simulation that allows students access to four different pre-set roles within an ambulatory care setting. Students assume each role to learn all aspects of an EHR and work with patient data to each role's ability and permission level. The unique feature of the system is its ability to provide two seemingly dichotomous functions giving a consistent role-based user experience for all students completing a class assignment and, at the same time, giving the student the ability to uniquely interact with her own patients' records. By interacting with each of these roles the student gains an understanding of how each role impacts Meaningful Use reporting: Office Receptionist - Records a patient's personal and payer information and checks in a patient for an appointment. Certified Nursing or Medical Assistant - Records a patient's vital signs for an encounter (appointment) and other medical history. Doctor, Registered Nurse, Nurse Practitioner, Physician Assistant (other clinicians would use role) - Records and codes a patient's medical procedure history and creates and signs notes and orders. Practice Manager - Reviews patient records for billing/payer purposes. The online EHR simulation program includes the following student activities Create a Patient Record Create an Appointment Check in a Patient Record Patient Vital Signs Record Patient Medications Create a Patient Note Start the Patient Order Process Explore Patient Orders Complete a Patient Order Use Doctor Desktop to Manage Your Patient Care Load Sign Notes and Orders Update Reference Information View Patient Events Each new workbook includes an access code to the online EHR training system. Electronic or eBook formats of the workbook do not include access to the online EHR. Demonstrates patient assessment and physical examination for pediatric emergencies; presents assessment and management factors and demonstrates management techniques for pediatric respiratory emergencies; presents the causes of, assessment factors for and demonstration of management techniques for shock and seizures in pediatric patients; and describes assessment and care for pediatric trauma patients. Describes the National Triage Trauma Protocol guidelines for categorizing trauma patients as well as common mechanisms of injury in adults and children and demonstrates assessment of trauma patients with and without significant mechanisms of injury.
