Decomposition Techniques in Mathematical Programming Antonio J. Conejo, Enrique Castillo, Roberto Minguez, Raquel Garcia-Bertrand, 2006-04-28 Optimization plainly dominates the design planning operation and control of engineering systems This is a book on optimization that considers particular cases of optimization problems those with a decomposable structure that can be advantageously exploited Those decomposable optimization problems are ubiquitous in engineering and science applications The book considers problems with both complicating constraints and complicating variables and analyzes linear and nonlinear problems with and without integer variables The decomposition techniques analyzed include Dantzig Wolfe Benders Lagrangian relaxation Augmented Lagrangian decomposition and others Heuristic techniques are also considered Additionally a comprehensive sensitivity analysis for characterizing the solution of optimization problems is carried out This material is particularly novel and of high practical interest This book is built based on many clarifying illustrative and computational examples which facilitate the learning procedure For the sake of clarity theoretical concepts and computational algorithms are assembled based on these examples The results are simplicity clarity and easy learning We feel that this book is needed by the engineering community that has to tackle complex optimization problems particularly by practitioners and researchers in Engineering Operations Research and Applied Economics The descriptions of most decomposition techniques are available only in complex and specialized mathematical journals difficult to understand by engineers A book describing a wide range of decomposition techniques emphasizing problem solving and appropriately blending theory and application was not previously available

Mathematical Programming Solver Based on Local Search Frédéric Gardi, Thierry Benoist, Julien Darlay, Bertrand Estellon, Romain Megel, 2014-07-09 This book covers local search for combinatorial optimization and its extension to mixed variable optimization Although not yet understood from the theoretical point of view local search is the paradigm of choice for tackling large scale real life optimization problems Today s end users demand interactivity with decision support systems For optimization software this means obtaining good quality solutions quickly Fast iterative improvement methods like local search are suited to satisfying such needs Here the authors show local search in a new light in particular presenting a new kind of mathematical programming solver namely LocalSolver based on neighborhood search First an iconoclast methodology is presented to design and engineer local search algorithms The authors concern regarding industrializing local search approaches is of particular interest for practitioners This methodology is applied to solve two industrial problems with high economic stakes Software based on local search induces extra costs in development and maintenance in comparison with the direct use of mixed integer linear programming solvers The authors then move on to present the LocalSolver project whose goal is to offer the power of local search through a model and run solver for large scale 0 1 nonlinear programming They conclude by presenting their ongoing and future work on LocalSolver toward a full mathematical programming solver based on local search

Cooperative and Noncooperative Multi-Level Programming Masatoshi Sakawa, Ichiro Nishizaki, 2009-07-01 To derive rational and convincing solutions to practical decision making problems in complex and hierarchical human organizations the decision making problems are formulated as relevant mathematical programming problems which are solved by developing optimization techniques so as to exploit characteristics or structural features of the formulated problems In particular for resolving conflict in decision making in hierarchical managerial or public organizations the multi level formulation of the mathematical programming problems has been often employed together with the solution concept of Stackelberg equilibrium However we conceive that a pair of the conventional formulation and the solution concept is not always sufficient to cope with a large variety of decision making situations in actual hierarchical organizations The following issues should be taken into consideration in expression and formulation of decision making problems In formulation of mathematical programming problems it is tacitly supposed that decisions are made by a single person while game theory deals with economic behavior of multiple decision makers with fully rational judgment Because two level mathematical programming problems are interpreted as static Stackelberg games multi level mathematical programming is relevant to noncooperative game theory in conventional multi level mathematical programming models employing the solution concept of Stackelberg equilibrium it is assumed that there is no communication among decision makers or they do not make any binding agreement even if there exists such communication However for decision making problems in such as decentralized large firms with divisional independence it is quite natural to suppose that there exists communication and some cooperative relationship among the decision makers
