Ignition Systems for Gasoline Engines Dec 15 2021 At the dawn of the automotive age, designing a suitable ignition system for the spark-ignition engine represented as formulated by automotive pioneer Carl Benz the crux of all our problems. Among the exceptional talents focused on resolving the thorny issues of the day was that of Robert Bosch. The ultimate result was the Bosch high-voltage magneto. The company registered a patent on this epoch-making system on 7 January, 1902, in the same year that the first units were delivered to customers in the automotive industry. At the same time, Bosch embarked upon the development and manufacture of yet another vital ignition component, the spark plug, an event which celebrated its 100th anniversary in 2002. This brochure from our automotive technology series starts with a thumbnail sketch tracing the evolution of ignition systems. It then proceeds to the design and operation of modern inductive ignition systems as installed in current passenger cars with spark-ignition engines. Two of this brochures central topics are the ignition coil and the spark plug, to which special sections have been devoted. These sections furnish detailed descriptions of the design, versions and operating concepts of various coil and plug models. Also included are descriptions of the particular demands imposed by direct gasoline injection and their implications for the selection of ignition components. The chapter on service technology offers insights into the methods employed to test ignition systems along with an overview of the test equipment used in service operations. Covers: -Historical retrospective-Design of inductive ignition systems-Ignition coils and spark plugs-Service technology

A Study of the Deterioration of Nickel Spark-Plug Electrodes in Service (Classic Reprint) May 08 2021 Excerpt from A Study of the Deterioration of Nickel Spark-Plug Electrodes in Service Although this defect was studied in detail in only one of the many varied forms of spark plugs, it became evident from the examination that the deterioration is a characteristic of the material - that is, of nickel wire - rather than of the particular type of spark plug in which it was noted and studied. It appears, however, that the mechanical features of the plugs have a considerable bearing on the time required for the deterioration to become serious. The results of this study of the deterioration of nickel electrodes in service should be of value to the makers of all types of spark plugs in which the electrodes are made of this metal.
