Unit 5 Population Dynamics

Answers to Unit Preparation Questions Assessing Student Readiness

(Student textbook pages 492–5)

1. A population is a group of organisms of one species that lives in the same place, at the same time, and can successfully reproduce, but a community refers to the populations of all the species that interact in a certain area.
2. c
3. Both ecosystems are aquatic. The main difference between the two ecosystems is that eels hatch, spawn and die in an ocean-based saltwater environment but live much of their lives in an inland freshwater environment. Each of these environments has different water conditions and provides different food sources.
4. a. True
b. False, carnivorous plants would not do well in conditions to which they are not well-adapted.
c. False, two or more species cannot occupy the same ecological niche.
5. d
6. a. Amount of sunlight, temperature range, and amount of precipitation.
b. Predatory insects, organisms that cause disease or that are parasitic, and competition for nutrients, space, and sunlight.
7. Each type of fish is a separate population in Lake Superior. Together, all of the fish make a community.
8. c
9. b
10. Sample caption: Fungi absorb nutrients from dead organisms on the forest floor.
11. If a keystone species is removed from an ecosystem, the ecosystem is harmed because the food web is disrupted. The balance in the ecosystem no longer exists and the ecosystem can collapse.
12. a. The hawk is a predator and the frog is the prey.
b. bunchgrass
c. spotted frog
d. grasshopper
e. energy
f. four
13. Decomposers would appear at each trophic level as they would extract energy from each organism when it dies.
14. a. No, because it is commonly accepted that less than 10% of available energy is transferred from one trophic level to the next.
b. Each organism uses much of the energy it consumes for its biological processes and some energy is transferred to the environment in the form of heat.
15. On average, only about 10 percent of the energy available at one trophic level is available to consumers at the next trophic level. Animals that make up the highest trophic level in any food web tend to be large, predatory species such as bears, lions, whales, and eagles. Since there is less biomass (and therefore less energy) from lower to higher trophic levels, there can only be a few of these large animals in any ecosystem compared with much larger numbers of organisms such as deer at lower trophic levels, where biomass and food energy is more plentiful.
16. Webs should include producers and a number of primary, secondary, and tertiary consumers, linked appropriately.
a. Freshwater lakes contain many omnivorous species. Producers might include algae, (some) bacteria, diatoms, and *Daphnia*. Primary consumers might include zooplankton and larvae of fish or amphibians. Secondary consumers might include insects, small fish, and frogs. Tertiary consumers might include large fish, predatory birds, and humans. Each level should be linked to decomposers (i.e., certain bacteria).
b. Forest webs should include distinct herbivores and carnivores/omnivores. Producers might include grasses, shrubs, trees, and wildflowers. Primary consumers might include forest herbivores such as bears, moose, deer, elk, rabbits, insects (grasshoppers), birds (seed eaters), small rodents (e.g., squirrels, chipmunks), and beaver. Secondary consumers might include insect- and rodent-eating birds (e.g., flycatchers, owls, hawks), weasels, foxes, and raccoons. Tertiary consumers might include

Woods,Andrew S. Flies,2019-03-20 Go into partnership with nature she does more than half the work and asks none of the fee Martin H Fisher Nature has undertaken an immense amount of work throughout evolution The evolutionary process has provided a power of information that can address key questions such as Which immune molecules and pathways are conserved across species Which molecules and pathways are exploited by pathogens to cause disease What methods can be broadly used or readily adapted for wild immunology How does co infection and exposure to a dynamic environment affect immunity Section 1 addresses these questions through an evolutionary approach Laboratory mice have been instrumental in dissecting the nuances of the immune system The first paper investigates the immunology of wild mice and reviews how evolution and ecology sculpt differences in the immune responses of wild mice and laboratory mice A better understanding of wild immunology is required and sets the scene for the subsequent papers Although nature doesn t ask for a fee it is appropriate that nature is repaid in one form or another The translational theme of the second section incorporates papers that translate wild immunology back to nature But any non human non laboratory mouse research environment is hindered by a lack of research tools hence the underlying theme throughout the second section Physiological resource allocation is carefully balanced according to the most important needs of the body Tissue

homeostasis can involve trade offs between energy requirements of the host and compensatory mechanisms to respond to infection The third section comprises a collection of papers that employ novel strategies to understand how the immune system is compensated under challenging physiological situations Technology has provided substantial advances in understanding the immune system at cellular and molecular levels The specificity of these tools e g monoclonal antibodies often limits the study to a specific species or strain A consequence of similar genetic sequences or cross reactivity is that the technology can be adapted to wild species Section 4 provides two examples of probing wild immunology by adapting technology developed for laboratory species
