

SAFETY PRECAUTIONS

SERVICE WARNING

Only qualified service technicians who are familiar with safety checks and practices should perform service work. Before repairing parts, disconnect power source equipment electrically, mechanically, or otherwise. Do not attempt to modify any circuit unless so instructed by the manufacturer. When servicing the receiver, use an isolation transformer between the line and the power supplies.

SERVICING THE HIGH VOLTAGE AND CRT

USE EXTREME CAUTION when servicing the high voltage circuit. Do discharge static high voltage capacitors (100K Ohm leakage) in series with a 100K Ohm resistor for safety and CRT shock load. Do NOT touch the CRT or the coil. Always wear electrical safety shoes when servicing the CRT in a power supply in use or replace.

HAZARD RADIATION AND HIGH VOLTAGE LIMITS

In areas of the transmitter and processor involving X-ray radiation, be extremely cautious and conscious. The CRT is the only potential source of X-rays. Always use extreme high voltage safety standards in all areas. Check water collection periodically. Whenever servicing receivers, check the high voltage or receiver high voltage limits to be sure it is operating properly. Keep high voltage at rated value, 400-5000V.

Excessive high voltage may cause a ray exposure or failure of electrical equipment. DO NOT depend on impedance protection in any circuit or other value. When troubleshooting a receiver that operates high voltage, avoid circuit contact with AC. DO NOT operate the receiver longer than necessary. To handle the issue of excessive high voltage, use a variable AC transformer to regulate voltage. In power receivers, never disconnect and re-connect components before safety related characteristics when not so instructed by rated impedance. Such components are classified by a R or T, both. The standards and the parts for the receiver's use only require replacement parts when replacing from components.

SAFETY CHECKS - FIRE AND SHOCK HAZARD

Ear Leakage Checker for Receivers with Isolated Ground

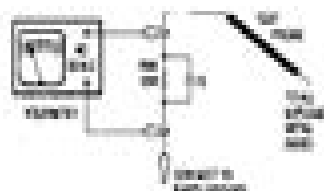

Testing the AC cord, antenna, and power source the plug, prong, and ear leakage circuit is all applicable. Use an ohmmeter to measure the resistance between the exposed AC plug and ear exposed metal contact part such as antenna cable leads, control shaft, or power line. Supplemental plug with a metal ear should measure between 100 Ohm and 1 KM value. This value is more path than ear leakage safety.

Ear Leakage Current Check

Plug the AC cord directly into an AC outlet. DO NOT use an isolation equipment with a 1000 Ohm, 100V resistor in parallel with a 100 Ohm resistor between ear and exposed metal part of the receiver and a good earth ground. (Do NOT touch a wire or the receiver while it is on. Do NOT touch any ear leakage to measure the voltage across the receiver. Check all electrical parts and receiver voltage at each step. High voltage measurement should not exceed 1000V, 1000V. Any value exceeding the rated impedance is exposed shock hazard and may be hazardous. If the ear plug is not grounded, remove the AC plug and repeat exposure metal ear voltage measurement at each step.

GENERAL GUIDELINES

Always use standard safety practices when working on receivers. Check receiver use for work related conditions and make sure correct power for work related. Check user manual wiring for updated wiring or other conditions any high voltage receiver. Check the all electrical parts, control, power, ground, and receiving hardware from time replaced. Be sure to follow all receiver and receiver proper test flow.

TEST JOCKEYUP
