Fundamentals of Ceramics Michel Barsoum, M.W Barsoum, 2002-11-27 Updated and improved this revised edition of Michel Barsoum's classic text *Fundamentals of Ceramics* presents readers with an exceptionally clear and comprehensive introduction to ceramic science. Barsoum offers introductory coverage of ceramics their structures and properties with a distinct emphasis on solid state physics and chemistry. Key equations are derived from first principles to ensure a thorough understanding of the concepts involved. The book divides naturally into two parts. Chapters 1 to 9 consider bonding in ceramics and their resultant physical structures and the electrical, thermal, and other properties that are dependent on bonding type. The second part, Chapters 11 to 16, deals with those factors that are determined by microstructure such as fracture and fatigue and thermal, dielectric, magnetic, and optical properties. Linking the two sections is Chapter 10, which describes sintering, grain growth, and the development of microstructure. *Fundamentals of Ceramics* is ideally suited to senior undergraduate and graduate students of materials science and engineering and related subjects.

*Fundamentals of Ceramics* Michel Barsoum, 2019-12-12 *Fundamentals of Ceramics* presents readers with an exceptionally clear and comprehensive introduction to ceramic science. This Second Edition updates problems and adds more worked examples as well as adding new chapter sections on Computational Materials Science and Case Studies. The Computational Materials Science sections describe how today's density functional theory and molecular dynamics calculations can shed valuable light on properties, especially ones that are not easy to measure or visualize otherwise, such as surface energies, elastic constants, point defect energies, phonon modes, etc. The Case Studies sections focus more on applications such as solid oxide fuel cells, optical fibers, alumina forming materials, ultra-strong and thin glasses, glass ceramics, strong and tough ceramics, fiber-reinforced ceramic matrix composites, thermal barrier coatings, the space shuttle tiles, electrochemical impedance spectroscopy, two-dimensional solids, field-assisted and microwave sintering, colossal magnetoresistance, among others.
