Authoritative reference guide, using the documents in which arms and armour first appeared to explain and define them. Medieval arms and armour are intrinsically fascinating. From the smoke and noise of the armourer's forge to the bloody violence of the battlefield or the silken panoply of the tournament, weapons and armour - and those who made and bore them - are woven into the fabric of medieval society. This sourcebook will aid anyone who seeks to develop a deeper understanding by introducing and presenting the primary sources in which these artefacts are first mentioned. Over seventy original documents are transcribed and translated, including wills, inventories, letters and chronicle accounts, from a period which saw rapid advances in military technology. The book also includes an extensive glossary, lavishly illustrated with forty images of extant armour and weapons from the period, and contemporary artistic depictions from illuminated manuscripts and other sources. This book will therefore be of interest to a wide audience, from the living history practitioner, crafter, and martial artist, to students of literature, military history, art, and material culture. It is hard to imagine a world without electronic communication networks, so dependent have we all become on the networks which now exist and have become part of the fabric of our daily lives. This book presents papers from CECNet 2023, the 13th International Conference on Electronics, Communications and Networks, held as a hybrid event, in person in Macau, China and online via Microsoft Teams, from 17-20 November 2023. This annual conference provides a comprehensive, global forum for experts and participants from academia to exchange ideas and present the results of ongoing research in state-of-the-art areas of electronics technology, communications engineering and technology, wireless communications engineering and technology, and computer engineering and technology. A total of 324 submissions were received for the conference, and those which qualified by virtue of falling under the scope of the conference topics were exhaustively reviewed by program committee members and peer-reviewers, taking into account the breadth and depth of the relevant research topics. The 101 selected contributions included in this book present innovative, original ideas or results of general significance, supported by clear and rigorous reasoning and compelling new light in both evidence and method. Subjects covered divide broadly into 3 categories: electronics technology and VLSI, internet technology and signal processing, and information communication and communication networks. Providing an overview of current research and developments in these rapidly evolving fields, the book will be of interest to all those working with digital communications networks. Along the last several decades, it has been progressively appreciated that immunology plays an overwhelming role in the physiology and pathophysiology of most organs, tissues, and biological systems in multicellular organisms. Accordingly, several immunological parameters are used in research and clinical laboratories with the purpose of investigating, diagnosing, and monitoring a variety of pathological conditions. The rapidly evolving field of laboratory testing in immunology poses several challenges to professionals working in research and clinical laboratories, medical practice, educational activities, in vitro diagnostic industry, and regulatory agencies. Regular analytes, such as albumin, glucose, and insulin, are homogeneous among individuals of the same species. This property represents an advantage when it comes to optimize the determination methods as well as to establish standardization and quality assessment strategies. In contrast, several immunologic analytes present tremendous variability across individuals in the same species. In fact, some are unique at the individual level. For example, the repertoire of immunoglobulins specific for a given pathogen (e.g., rubella) is specific for each individual in terms of the balance of targeted antigens and epitopes, immunoglobulin isotypes, antibody avidity, Fc glycosylation rate, and so on. As a corollary, the panel of anti-rubella antibodies is necessarily different from one to other individual. This also applies to autoantibodies and to IgE to allergens. Polymorphism is prevalent for other immunologic parameters, such as Complement components, cell receptors (cluster differentiation molecules - CD) and downstream signal transduction mediators.
