This book deals with the impact of uncertainty in input data on the outputs of mathematical models. Uncertain inputs as scalars, tensors, functions, or domain boundaries are considered. In practical terms, material parameters or constitutive laws, for instance, are uncertain, and quantities as local temperature, local mechanical stress, or local displacement are monitored. The goal of the worst scenario method is to extremize the quantity over the set of uncertain input data. A general mathematical scheme of the worst scenario method, including approximation by finite element methods, is presented, and then applied to various state problems modeled by differential equations or variational inequalities: nonlinear heat flow, Timoshenko beam vibration and buckling, plate buckling, contact problems in elasticity and thermoelasticity with and without friction, and various models of plastic deformation, to list some of the topics. Dozens of examples, figures, and tables are included. Although the book concentrates on the mathematical aspects of the subject, a substantial part is written in an accessible style and is devoted to various facets of uncertainty in modeling and to the state of the art techniques proposed to deal with uncertain input data. A chapter on sensitivity analysis and on functional and convex analysis is included for the reader's convenience. · Rigorous theory is established for the treatment of uncertainty in modeling · Uncertainty is considered in complex models based on partial differential equations or variational inequalities · Applications to nonlinear and linear problems with uncertain data are presented in detail: quasilinear steady heat flow, buckling of beams and plates, vibration of beams, frictional contact of bodies, several models of plastic deformation, and more · Although emphasis is put on theoretical analysis and approximation techniques, numerical examples are also present · Main ideas and approaches used today to handle uncertainties in modeling are described in an accessible form · Fairly self-contained book "Current labor, material and equipment costs for repair and remodeling work." A survey of the instruments and methods that are available for assessment of psychopathology and behavior problems in persons with mental retardation. Instruments are described and evaluated from a methodological perspective. Haynes offers the best coverage for cars, trucks, vans, SUVs and motorcycles on the market today. Almost all chapters have been revised, updated and re-arranged. THIS BOOK PREDICTED COLUMBIA DISASTER.. NASA New Millennium Problems and Solutions is a wake up call about the dire conditions of the U.S. space transportation program. NASAs management philosophy of faster, better, cheaper has resulted in the Agency trying to do, too much... with too little... too fast. The space programs momentum has been eroded by NASAs numerous project failures, cost overruns, and mismanagement. NASAs space transportation operations have been compromised to the point where serious safety conditions exist. Astronauts, ground personnel, and even the general public are exposed to unsafe flight operations. This book examines the following daunting questions: Why isnt the Space Shuttle safe? Why doesnt the Space Shuttle have a crew escape system? What happened to NASAs commercial Space Shuttle? Will the International Space Station be worth the cost? Was the X-33/VentureStar launch project a \$1 billion blunder? Are the proposed X-33 population over-flight tests safe? Will the human exploration of Mars be postponed for decades? Is there light at the end of this dark tunnel? This book gives the reader with an insiders knowledge of decisions that have placed the future of the U.S. space transportation programs in grave peril. It is a compelling reading for the space enthusiast, the aerospace professional community, those seeking aerospace careers, and political supporters and opponents of the space program. Haynes offers the best coverage for cars, trucks, vans, SUVs and motorcycles on the market today.
