web new species form by speciation in which an ancestral population splits into two or more genetically distinct descendant populations speciation involves reproductive isolation of groups within the original population and accumulation of web sexual selection has a reputation as a major cause of speciation one of the most potent forces driving reproductive isolation this reputation arises from observations that species differ most in traits involved with mating success and from successful models of sexual selection driven speciation web we argue that understanding causal pathways linking anthropogenic change to sexual selection and speciation is critical to predicting the fate of biodiversity in the anthropocene web under the commonly used biological species concept mayr 1942 the formation of new species involves the evolution of reproductive barriers to the production of viable offspring either web here you can explore different ways to define a species and learn about the various processes through which speciation can occur this section also addresses the topics of cospeciation when two lineages split in concert with one another and modes of speciation that are specific to plants web jul 1 2024 empirical evidence demonstrates that anthropogenic change alters sexual selection and that sexual selection influences speciation yet there are almost no studies directly connecting these three processes web natural selection has always been considered a key component of adaptive divergence and speciation 2 15 17 but the importance of selection has been eclipsed in recent decades by a strong focus on the geography of speciation and on the purely genetic mechanisms by which reproductive isolation evolves see refs 18 20 for reviews web sexual selection has a reputation as a major cause of speciation one of the most potent forces driving reproductive isolation this reputation arises from observations that species differ most in traits involved with mating success and from successful models of sexual selection driven speciation web jul 24 2024 when the pruning and sprouting of the tree of life are selective and favor certain properties of the species over others i e species sorting or species selection speciation and extinction become effective builders of evolutionary active trends that spur lineages into unexplored regions of the morphospace 11 13 see note added in web sexual selection theory is extended to encompass social competition for resources other than mates characters used in social competition can undergo particularly rapid and divergent evolution owing to 1 their great importance in determining access to critical resources 2 the absence of a limit to change except by selection in other web speciation is an evolutionary process by which a new species comes into being a species is a group of organisms that can reproduce with one another to produce fertile offspring and is web here we conduct a meta analysis of the comparative evidence and find a small but significant positive overall correlation between sexual selection and speciation rate however we also find that effect size estimates are influenced by methodological choices web jul 1 2001 speciation the splitting of one species into two or more occurs by sexual selection when a parallel change in mate preference and secondary sexual traits within a population leads to prezygotic isolation between populations and when this is the primary cause of reproductive isolation web jun 20 2024 speciation the formation of new and distinct species by splitting a single lineage into two or more genetically independent ones hypotheses regarding how speciation begins differ in the role of geographic isolation and the origin of reproductive isolation preventing populations from breeding with one another web experimental results the first steps of speciation have been produced in several laboratory experiments involving geographic isolation for example diane dodd examined the effects of geographic isolation and selection on fruit flies web natural selection is the differential survival and reproduction of individuals due to differences in phenotype it is a key mechanism of evolution the change in the heritable traits characteristic of a population over generations web nov 11 2000 natural selection has always been considered a key component of adaptive divergence and speciation 2 15 17 but the importance of selection has been eclipsed in recent decades by a strong focus on the geography of speciation and on the purely genetic mechanisms by which reproductive isolation evolves see refs web feb 18 2014 speciation is a central and fundamental process in evolution that concerns the origin of reproductive isolation the latest generation of genomic approaches provide remarkable opportunities to web jun 6 2010 this paper begins by briefly reviewing the various roles that selection plays in speciation but then focuses on how it leads to sympatry by selecting for reduced recombination and for the use of different limiting resources web speciation is a lineage splitting event that produces two or more separate species imagine that you are looking at a tip of the tree of life that constitutes a species of fruit fly move down the phylogeny to where your fruit fly twig is connected to the rest of the tree
