Concepts to Know

WATER

Why so special and important?

Nearly 75% of our earth is covered in water.

Our bodies are 60-65% water. Our blood is 85% water.

None of the many reactions that occur in our bodies would occur without water.

Composition of water: H_2O

Properties of Water

- Water is **POLAR**.

The diagram shows that one side of the water molecule is **positively charged** and the other is **negatively charged**.

The molecule itself is neutral. These opposite charges make water a **polar molecule**.

- Water undergoes **ADHESION** and **COHESION** due to its polarity.

The **negative oxygen** of one water molecule is attracted to the **positive hydrogen** of another molecule forming a **hydrogen bond**. In other words water likes to stick to itself. Water sticking to water is called **cohesion**. Water's polarity allows it to attract to other surfaces too (like glass). Water sticking to something else is called **adhesion**.

1. In the diagram to the right use dotted lines to draw in the bonds that form between water molecules.

Positives connect to negatives, up to four bonds per water molecule.

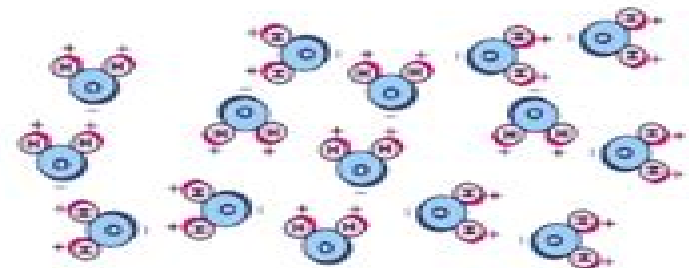

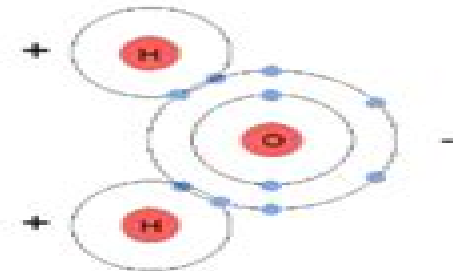

2. What is the name of this type of bond?

Hydrogen or "H" bond

3. What special property do the bonds give to water.

Several: cohesion first and foremost (water sticking to itself).

Creates surface tension on the water (water skipper can seemingly "walk" on water)

CHEMICAL BASIS OF LIFE DAVID FRASER. HARRIS,2018 Chemical Basis of Life D. F. Fraser-Harris,1912 **A Speculation Concerning the Chemical Basis of Life** Brenning James,1957 *The Physical Basis of Life* John Desmond Bernal,1951 **The Chemistry of Life's Origins** J. Mayo Greenberg,C.X. Mendoza-Gómez,Valerio Pirronello,2012-12-06

This volume contains the lectures presented at the second course of the International School of Space Chemistry held in Erice Sicily from October 20 30 1991 at the E Majorana Centre for Scientific Culture The course was attended by 58 participants from 13 countries The Chemistry of Life s Origins is well recognized as one of the most critical subjects of modern chemistry Much progress has been made since the amazingly perceptive contributions by Oparin some 70 years ago when he first outlined a possible series of steps starting from simple molecules to basic building blocks and ultimate assembly into simple organisms capable of replicating catalysis and evolution to higher organisms The pioneering experiments of Stanley Miller demonstrated already forty years ago how easy it could have been to form the amino acids which are critical to living organisms However we have since learned and are still learning a great deal more about the primitive conditions on earth which has led us to a rethinking of where and how the condition for prebiotic chemical processes occurred We have also learned a great deal more about the molecular basis for life For instance the existence of DNA was just discovered forty years ago **Concepts of Biology** Samantha Fowler,Rebecca Roush,James Wise,2023-05-12

Black white print Concepts of Biology is designed for the typical introductory biology course for nonmajors covering standard scope and sequence requirements The text includes interesting applications and conveys the major themes of biology with content that is meaningful and easy to understand The book is designed to demonstrate biology concepts and to promote scientific literacy **Molecular Biology of the Cell** ,2002 *The Chemical Basis for Evolution* David Paretsky,University of Kansas,1962 The Physical Basis of Life ,1972 Bringing Chemistry to Life Robert Joseph Paton Williams,J. J. R. Fraústo da Silva,1999

In this book the authors describe the long journey from formless inanimate matter to man explaining the nature and the logic of the physical chemical processes involved It stresses the limitations of reductionism analyses of these processes as complexity increases and novel properties emerge And in particular the authors develop the idea that it was chemical change of the environment that allowed evolution of life to occur and that this evolution required successive addition of new message systems and information codes connected compatible and cooperative with previous extant systems In doing so the authors analyze the relationship between chemical element content and speciation both in inanimate and living systems in terms of fundamental units and variables or composite derived units and variables Through such analysis the authors conclude that chemical speciation is very much a matter of chemical cooperation order versus disorder while biological speciation requires cooperative flow of chemicals and energy organization versus disorder They argue that chance

mutations of DNA are far too simple to provide a basis for evolution and biological diversity though it is a representation of such diversity It is the survival strength of systems of molecular machinery which separate and generate living species In the final chapter they analyze the effect of man s activities on the present global and local ecosystems and speculate on the possible nature of the emergent properties to be expected from an ever increasing complexity of information based modern societies

How Tobacco Smoke Causes Disease United States. Public Health Service. Office of the Surgeon General, 2010 This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke Many Surgeon General s reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies Mechanisms of disease are important because they may provide plausibility which is one of the guideline criteria for assessing evidence on causation This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers

whether a mechanism is likely to be operative in the production of human disease by tobacco smoke This evidence is relevant to understanding how smoking causes disease to identifying those who may be particularly susceptible and to assessing the potential risks of tobacco products *Answers for Aristotle* Massimo Pigliucci, 2012-10-02 Philosopher and biologist Massimo Pigliucci uses the combination of science and philosophy to answer questions about morality love friendship justice and politics
