Maldonado, 2020-01-24 This book focuses on the use of molecular tools to study small populations of rare and endangered mammals and presents case studies that apply an evolutionary framework to address innovative questions in the emerging field of mammalian conservation genomics using a highly diverse set of novel molecular tools. Novel and more precise molecular technologies now allow experts in the field of mammalogy to interpret data in a more contextual and empirical fashion and to better describe the evolutionary and ecological processes that are responsible for the patterns they observe. The book also demonstrates how recent advances in genetic/genomic technologies have been applied to assess the impact of environmental/anthropogenic changes on the health of small populations of mammals. It examines a range of issues in the field of mammalian conservation genomics, such as the role that the genetic diversity of the immune system plays in disease protection and local adaptation, the use of noninvasive techniques and genomic banks as a resource for monitoring and restoring populations, the structuring of population by physical barriers, and genetic diversity. Further, by integrating research from a variety of areas including population genetics, molecular ecology,

systematics and evolutionary and conservation biology it enables readers to gain a deeper understanding of the conservation biology of mammals that are at increasing risk of extinction at local regional and global scales As such it offers a unique resource for a broad readership interested in the conservation biology of mammals and conservation management strategies to better preserve biodiversity
