**Turbulence in the Solar Wind** Roberto Bruno, Vincenzo Carbone, 2016-10-07 This book provides an overview of solar wind turbulence from both the theoretical and observational perspective. It argues that the interplanetary medium offers the best opportunity to directly study turbulent fluctuations in collisionless plasmas. In fact, during expansion, the solar wind evolves towards a state characterized by large amplitude fluctuations in all observed parameters, which resembles, at least at large scales, the well-known hydrodynamic turbulence. This text starts with historical references to past observations and experiments on turbulent flows. It then introduces the Navier-Stokes equations for a magnetized plasma, whose low-frequency turbulence evolution is described within the framework of the MHD approximation. It also considers the scaling of plasma and magnetic field fluctuations and the study of nonlinear energy cascades within the same framework. It reports observations of turbulence in the ecliptic and at high latitude, treating Alfvénic and compressive fluctuations separately in order to explain the transport of mass, momentum, and energy during the expansion. Further, existing models are compared with direct observations in the heliosphere. The problem of self-similar and anomalous fluctuations in the solar wind is then addressed using tools provided by dynamical system theory and discussed on the basis of available models and observations. The book highlights observations of Yaglom's law in solar wind turbulence, which is one of the most important findings in fully developed turbulence and directly related to the long-lasting and still unsolved problem of solar wind plasma heating. Lastly, it includes a short chapter dedicated to the kinetic range of fluctuations, which has recently been receiving more attention from the space plasma community since this is inherently related to turbulent energy dissipation and consequent plasma heating. It particularly focuses on the nature and role of the fluctuations populating this frequency range and discusses several model predictions and recent observational findings in this context.

*Perseus in Sicily (IAU S342)* Keiichi Asada, Elisabete de Gouveia Dal Pino, Marcello Giroletti, Hiroshi Nagai, Rodrigo Nemmen, 2020-01-31  
Perseus is an outstanding case in which to study the physics of relativistic plasma and thermal gas and the interplay between galactic nuclei and galaxy clusters. Ground and space observatories have recently provided some ground breaking insights into the Perseus system from a detailed image of a jet launched in the vicinity of a supermassive black hole through VLBI to an unexpected degree of turbulence in the cluster core constrained by high energy resolution in x rays. While preparing for the next generation observatories that will allow readers to address these questions in other systems, this volume provides some first steps in exploring topics relating to particle acceleration, energy transport between large and small scales and the role of magnetic fields in the launch of relativistic jets. Chapters deal with the latest results covering theory, observations and numerical simulations spanning a wide range in physical scales and energy ranges.

**The Little Ice Age** Brian Fagan, 2019-11-26  
Only in the last decade have climatologists developed an accurate picture of yearly climate conditions in historical times. This development confirmed a long standing suspicion that the world endured a 500 year cold snap, The Little Ice Age, that lasted roughly from A.D. 1300 until 1850. The Little Ice Age tells the story of the turbulent, unpredictable and often very cold years of modern European history, how climate altered historical events and what they mean in the context of today's global warming. With its basis in cutting edge science, The Little Ice Age offers a new perspective on familiar events. Renowned archaeologist Brian Fagan shows how the increasing cold affected Norse exploration, how changing sea temperatures caused English and Basque fishermen to follow vast shoals of cod all the way to the New World, how a generations long subsistence crisis in France contributed to social disintegration and ultimately revolution, and how English efforts to improve farm productivity in the face of a deteriorating climate helped pave the way for the Industrial Revolution and hence for global warming. This is a fascinating original book for anyone interested in history, climate or the new subject of how they interact.

The Atmosphere and Climate of Mars Robert M. Haberle, R. Todd Clancy, François Forget, Michael D. Smith, Richard W. Zurek, 2017-06-29  
Humanity has long been fascinated by the planet Mars. Was its climate ever conducive to life? What is the atmosphere like today and why did it change so dramatically over time? Eleven spacecraft have successfully flown to Mars since the Viking mission of the 1970s and early 1980s. These orbiters, landers and rovers have generated vast amounts of data that now span a Martian decade, roughly eighteen years. This new volume brings together the many new ideas about the atmosphere and climate system that have emerged, including the complex interplay of the volatile and dust cycles, the atmosphere surface interactions that connect them over time and the diversity of the planet's environment and its complex history. Including tutorials and explanations of complicated ideas, students, researchers and non specialists alike are able to use this resource to gain a thorough and up to date understanding of this most Earth like of planetary neighbours.
