Keeping Patients Safe Dec 06 2021 Building on the revolutionary Institute of Medicine reports *To Err is Human* and *Crossing the Quality Chasm*, *Keeping Patients Safe* lays out guidelines for improving patient safety by changing nurses' working conditions and demands. Licensed nurses and unlicensed nursing assistants are critical participants in our national effort to protect patients from health care errors. The nature of the activities nurses typically perform — monitoring patients, educating home caretakers, performing treatments, and rescuing patients who are in crisis — provides an indispensable resource in detecting and remedying error-producing defects in the U.S. health care system. During the past two decades, substantial changes have been made in the organization and delivery of health care — and consequently in the job description and work environment of nurses. As patients are increasingly cared for as outpatients, nurses in hospitals and nursing homes deal with greater severity of illness. Problems in management practices, employee deployment, work and workspace design, and the basic safety culture of health care organizations place patients at further risk. This newest edition in the groundbreaking Institute of Medicine *Quality Chasm* series discusses the key aspects of the work environment for nurses and reviews the potential improvements in working conditions that are likely to have an impact on patient safety.

Safe Patient Handling and Mobility: Interprofessional National Standards Feb 17 2023 Injuries and musculoskeletal disorders (MSDs) are common in nurses and other healthcare workers and are often caused by manually lifting and moving patients. This is more than just an inconvenience; these injuries are often life altering and career ending. ANA's new breakthrough guide will help to prevent injuries and protect nurses and other healthcare workers. The guide contains eight overarching safe patient handling and mobility (SPHM) standards. These national interdisciplinary standards address the responsibilities of the employer or health care organization and those of healthcare workers and ancillary/support staff and are applicable across the care continuum. Following these standards is critical for hospitals and other healthcare organizations in promoting a culture of safety through the development of safe and effective SPHM programs. Don't waste another day. Protect employees, improve attendance rates and reduce workers' compensation costs.

Safe Patient Handling Jan 31 2024 Nursing personnel are consistently listed as one of the top ten occupations for work-related musculoskeletal disorders, with incidence rates of 8.8 per 100 in hospital settings and 13.5 per 100 in nursing home settings. Strategies to prevent or minimize work-related musculoskeletal injuries associated with patient handling are often based on tradition and personal experience rather than scientific evidence. The most common patient handling approaches in the United States include manual patient lifting, classes in body mechanics, training in safe lifting techniques, and back belts.

Safe Patient Handling Training for Schools of Nursing May 23 2023 In the field of nursing, work-related musculoskeletal disorders (MSDs), such as back and shoulder injuries, persist as the leading and most costly U.S. occupational health problem. A large body of evidence indicates that a substantial number of work-related MSDs reported by nurses are due to the cumulative effect of repeated manual patient-handling activities and work done in extreme static awkward postures. In a list of at-risk occupations for musculoskeletal disorders in 2007, nursing aides, orderlies, and attendants ranked first in incidence rate with a case rate of 252 cases per 10,000 workers, a rate seven times the national MSD average for all occupations. Emergency medical personnel ranked second, followed by laborers and material movers, ticket agents and travel clerks, and light and heavy truck drivers among the top six at-

risk occupations [Department of Labor, Bureau of Labor Statistics (BLS), 2009]. The nursing occupation also typically ranks in the top ten in yearly incidence rate of sprain and strain injuries. In most industries MSD injury rates have declined in recent years, yet MSD rates for nurses in the healthcare industry have not declined during the same period. Healthcare units at high risk for back and other injuries to caregivers have certain characteristics: History of frequent injuries, High proportion of dependent patients, Lack of use of lifting equipment in good repair, Low staffing levels. More than 30 years of evidence has demonstrated that manual patient handling and relying on body mechanics is unsafe. Furthermore, this evidence indicates that adoption of safe patient handling (SPH) techniques, where nurses use assistive equipment during transfers, is effective in reducing the incidence of MSDs related to the handling of patients.

The personal and financial cost of back pain and injuries to health staff means there is an urgent need to improve practice in this area. Over the past twenty years a number of guidelines have been published, however, these have been based on professional consensus rather than evidence. Evidence-Based Patient Handling tackles the challenge of producing an evidence base to support clinical practice and covers tasks, equipment and interventions. This book questions previously held opinions about moving and handling and provides the foundation for future practice.
