Solutions Problems Classical Electrodynamics

Problems in Classical Electromagnetism Andrea Macchi, Giovanni Moruzzi, Francesco Pegoraro, 2023-05-29 This second edition adds 46 new problems for a total of 203 The solutions to certain old problems have been revised for improved clarity in response to questions and comments from our students second year students in the Master s in Physics program Each problem is given a title indicating its relation to the various areas of physics or technology By tackling the problems presented here students are gently introduced to advanced topics such as unipolar and homopolar motors magnetic monopoles radiation pressure angular momentum of light bulk and surface plasmons and radiation friction We also address a number of tricky concepts and apparent ambiguities and paradoxes encountered in the classical theory of electromagnetism with a particular focus on conservation laws and transformation properties between different frames of reference At the same time the book can be used as an introduction to applications of classical electromagnetism including cutting edge topics like plasmonics metamaterials and light driven propulsion While unnecessary mathematical complexity is avoided the new edition also provides a few introductory examples concerning elegant and powerful solution techniques Hopefully the second edition offers an even better teaching tool for undergraduates in physics mathematics and electric engineering and a valuable reference guide for students planning to work in optics material science electronics and plasma physics

Solved Problems in Classical Electrodynamics and Theory of Relativity Daniel Radu, Ioan Merches, 2023-11-23 This book is intended for undergraduate and graduate students in physics engineering astronomy applied mathematics and for researchers working in related subjects It is an excellent study tool for those students who would like to work independently on more electrodynamics problems in order to deepen their understanding and problem solving skills The book discusses main concepts and techniques related to Maxwell s equations potentials and fields including Li nard Wiechert potentials electromagnetic waves and the interaction and dynamics of charged point particles It also includes content on magnetohydrodynamics and plasma radiation and antennas special relativity relativistic kinematics relativistic dynamics and relativistic covariant dynamics and general theory of relativity It contains a wide range of problems ranging from electrostatics and magnetostatics to the study of the stability of dynamical systems field theories and black hole orbiting The book even contains interdisciplinary problems from the fields of electronics elementary particle theory antenna design Detailed step by step calculations are presented meeting the need for a thorough understanding of the reasoning and steps of the calculations by all students regardless of their level of training Additionally numerical solutions are also proposed and accompanied by adjacent graphical representations and even multiple methods of solving the same problem It is structured in a coherent and unified way having a deep didactic character being thus oriented towards a university environment where the transmission of knowledge in a logical unified and coherent way is essential It teaches students how to think about and how to approach solving electrodynamics problems Contains a wide range of problems and applications from the fields of electrodynamics and the theory of special relativity Presents numerical solutions to problems involving nonlinearities Details command lines specific to Mathematica software dedicated to both analytical and numerical calculations which allows readers to obtain the numerical solutions as well as the related graphical representations
