The Democratization of Artificial Intelligence Andreas Sudmann, 2019-10-31
After a long time of neglect Artificial Intelligence is once again at the center of most of our political economic and socio cultural debates Recent advances in the field of Artificial Neural Networks have led to a renaissance of dystopian and utopian speculations on an AI rendered future Algorithmic technologies are deployed for identifying potential terrorists through vast surveillance networks for producing sentencing guidelines and recidivism risk profiles in criminal justice systems for demographic and psychographic targeting of bodies for advertising or propaganda and more generally for automating the analysis of language text and images Against this background the aim of this book is to discuss the heterogeneous conditions implications and effects of modern AI and Internet technologies in terms of their political dimension What does it mean to critically investigate efforts of net politics in the age of machine learning algorithms

Elements of Causal Inference Jonas Peters, Dominik Janzing, Bernhard Schölkopf, 2017-11-29
A concise and self contained introduction to causal inference increasingly important in data science and machine learning The mathematization of causality is a relatively recent development and has become increasingly important in data science and machine learning This book offers a self contained and concise introduction to causal models and how to learn them from data After explaining the need for causal models and discussing some of the principles underlying causal inference the book teaches readers how to use causal models how to compute intervention distributions how to infer causal models from observational and interventional data and how causal ideas could be exploited for classical machine learning problems All of these topics are discussed first in terms of two variables and then in the more general multivariate case The bivariate case turns out to be a particularly hard problem for causal learning because there are no conditional independences as used by classical methods for solving multivariate cases

The authors consider analyzing statistical asymmetries between cause and effect to be highly instructive and they report on their decade of intensive research into this problem. The book is accessible to readers with a background in machine learning or statistics and can be used in graduate courses or as a reference for researchers. The text includes code snippets that can be copied and pasted, exercises, and an appendix with a summary of the most important technical concepts.

Linear Algebra and Optimization for Machine Learning Charu C. Aggarwal, 2020-05-13. This textbook introduces linear algebra and optimization in the context of machine learning. Examples and exercises are provided throughout the book. A solution manual for the exercises at the end of each chapter is available to teaching instructors. This textbook targets graduate level students and professors in computer science, mathematics, and data science. Advanced undergraduate students can also use this textbook. The chapters for this textbook are organized as follows:

1. Linear algebra and its applications. The chapters focus on the basics of linear algebra together with their common applications to singular value decomposition, matrix factorization, similarity matrices, kernel methods, and graph analysis. Numerous machine learning applications have been used as examples, such as spectral clustering, kernel based classification, and outlier detection. The tight integration of linear algebra methods with examples from machine learning differentiates this book from generic volumes on linear algebra. The focus is clearly on the most relevant aspects of linear algebra for machine learning and to teach readers how to apply these concepts.
2. Optimization and its applications. Much of machine learning is posed as an optimization problem in which we try to maximize the accuracy of regression and classification models. The parent problem of optimization centric machine learning is least squares regression. Interestingly, this problem arises in both linear algebra and optimization and is one of the key connecting problems of the two fields. Least squares regression is also the starting point for support vector machines, logistic regression, and recommender systems. Furthermore, the methods for dimensionality reduction and matrix factorization also require the development of optimization methods. A general view of optimization in computational graphs is discussed together with its applications to back propagation in neural networks. A frequent challenge faced by beginners in machine learning is the extensive background required in linear algebra and optimization. One problem is that the existing linear algebra and optimization courses are not specific to machine learning; therefore, one would typically have to complete more course material than is necessary to pick up machine learning. Furthermore, certain types of ideas and tricks from optimization and linear algebra recur more frequently in machine learning than other application centric settings. Therefore, there is significant value in developing a view of linear algebra and optimization that is better suited to the specific perspective of machine learning.

Pattern Recognition and Classification Geoff Dougherty, 2012-10-28. The use of pattern recognition and classification is fundamental to many of the automated electronic systems in use today. However, despite the existence of a number of notable books in the field, the subject remains very challenging, especially for the beginner. *Pattern Recognition and Classification* presents a comprehensive introduction to the core concepts involved in automated pattern recognition. It is

designed to be accessible to newcomers from varied backgrounds but it will also be useful to researchers and professionals in image and signal processing and analysis and in computer vision Fundamental concepts of supervised and unsupervised classification are presented in an informal rather than axiomatic treatment so that the reader can quickly acquire the necessary background for applying the concepts to real problems More advanced topics such as semi supervised classification combining clustering algorithms and relevance feedback are addressed in the later chapters This book is suitable for undergraduates and graduates studying pattern recognition and machine learning
