

# THE MUSCULAR SYSTEM

Muscles, the specialized tissues that facilitate body movement, make up about 40% of body weight. Most body muscle is the voluntary type, called skeletal muscle because it is attached to the bony skeleton. Skeletal muscle contributes to body contours and shape, and it composes the organ system called the muscular system. These muscles allow you to grin, frown, run, swim, shake hands, swing a hammer, and to otherwise manipulate your environment. The balance of body muscle is smooth and cardiac muscles, which form the bulk of the walls of hollow organs and the heart. Smooth and cardiac muscles are involved in the transport of materials within the body.

Study activities in this chapter deal with microscopic and gross structure of muscle, identification of voluntary muscles, body movements, and important understandings of muscle physiology.

Pittman, 2016-08-18 This presentation describes various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion Oxygen that

has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate ATP the energy currency of all cells The mitochondria are able to produce ATP until the oxygen tension or PO<sub>2</sub> on the cell surface falls to a critical level of about 4.5 mm Hg Thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO<sub>2</sub> In order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved

*Skeletal Muscle Circulation* Ronald J. Korthuis, 2011 The aim of this treatise is to summarize the current understanding of the mechanisms for blood flow control to skeletal muscle under resting conditions how perfusion is elevated exercise hyperemia to meet the increased demand for oxygen and other substrates during exercise mechanisms underlying the beneficial effects of regular physical activity on cardiovascular health the regulation of transcapillary fluid filtration and protein flux across the microvascular exchange vessels and the role of changes in the skeletal muscle circulation in pathologic states Skeletal muscle is unique among organs in that its blood flow can change over a remarkably large range Compared to blood flow at rest muscle blood flow can increase by more than 20 fold on average during intense exercise while perfusion of certain individual white muscles or portions of those muscles can increase by as much as 80 fold This is compared to maximal increases of 4 to 6 fold in the coronary circulation during exercise These increases in muscle perfusion are required to meet the enormous demands for oxygen and nutrients by the active muscles Because of its large mass and the fact that skeletal muscles receive 25% of the cardiac output at rest sympathetically mediated vasoconstriction in vessels supplying this tissue allows central hemodynamic variables e.g blood pressure to be spared during stresses such as hypovolemic shock Sympathetic vasoconstriction in skeletal muscle in such pathologic conditions also effectively shunts blood flow away from muscles to tissues that are more sensitive to reductions in their blood supply that might otherwise occur Again because of its large mass and percentage of cardiac output directed to skeletal muscle alterations in blood vessel structure and function with chronic disease e.g hypertension contribute significantly to the pathology of such disorders Alterations in skeletal muscle vascular resistance and or in the exchange properties of this vascular bed also modify transcapillary fluid filtration and solute movement across the microvascular barrier to influence muscle function and contribute to disease pathology Finally it is clear that exercise training induces an adaptive transformation to a protected phenotype in the vasculature supplying skeletal muscle and other tissues to promote overall cardiovascular health
