Introductory Econometrics:

Asia Pacific Edition with Online Study Tools 12 Months Jeffrey M. Wooldridge, Mokhtarul Wadud, Jenny Lye, 2016-10-24 Econometrics is the combined study of economics and statistics and is an applied unit. It is increasingly becoming a core element in finance degrees at upper levels. This first local adaptation of Wooldridge's text offers a version of Introductory Econometrics with a structural redesign that will better suit the market along with Asia Pacific examples and data. Two new chapters at the start of the book have been developed from material originally in Wooldridge's appendix section to serve as a clear introduction to the subject and as a revision tool that bridges students' transition from basic statistics into econometrics. This adaptation includes data sets from Australian and New Zealand as well as from the Asia Pacific region to suit the significant portion of finance students who are from Asia and the likelihood that many graduates will find employment overseas.

Introduction to Econometrics Christopher Dougherty, 2011-03-03 Taking a modern approach to the subject, this text provides students with a solid grounding in econometrics using non-technical language wherever possible.

Introductory Econometrics Jeffrey M. Wooldridge, 2000

Econometric Analysis of Cross Section and Panel Data, second edition Jeffrey M. Wooldridge, 2010-10-01 The second edition of a comprehensive state-of-the-art graduate level text on microeconomic methods, substantially revised and updated. The second edition of this acclaimed graduate text provides a unified treatment of two methods used in contemporary econometric research: cross-section and data panel methods. By focusing on assumptions that can be given behavioral content, the book maintains an appropriate level of rigor while emphasizing intuitive thinking. The analysis covers both linear and nonlinear models, including models with dynamics and/or individual heterogeneity. In addition to general estimation frameworks, particular methods of moments and maximum likelihood, specific linear and nonlinear methods are covered in detail, including probit and logit models and their multivariate Tobit models, models for count data, censored and missing data schemes, causal or treatment effects, and duration analysis.

Econometric Analysis of Cross Section and Panel Data was the first graduate econometrics text to focus on microeconomic data structures, allowing assumptions to be separated into population and sampling assumptions. This second edition has been substantially updated and revised. Improvements include a broader class of models for missing data problems, more detailed treatment of cluster problems, an important topic for empirical researchers, expanded discussion of generalized instrumental variables, GIV estimation, new coverage based on the author's own recent research of inverse probability weighting, a more complete framework for estimating treatment effects with panel data, and a firmly established link between econometric approaches to nonlinear panel data and the generalized estimating equation literature popular in statistics and other fields. New attention is given to explaining when particular econometric methods can be applied; the goal is not only to tell readers what does work but why certain obvious procedures do not. The numerous included exercises, both theoretical and computer-based, allow the reader to extend methods covered in the text and discover new insights.
