both theoretical concepts and practical applications Technical and mathematical material is augmented with explanatory worked examples and case studies illustrate the application of these models in the broader business context This second edition covers recent developments in machine learning especially in a new chapter on deep learning and two new chapters that go beyond predictive analytics to cover unsupervised learning and reinforcement learning

Pattern Recognition
Sergios Theodoridis, Konstantinos Koutroumbas, 2003-05-15 Pattern recognition is a scientific discipline that is becoming increasingly important in the age of automation and information handling and retrieval Patter Recognition 2e covers the entire spectrum of pattern recognition applications from image analysis to speech recognition and communications This book presents cutting edge material on neural networks a set of linked microprocessors that can form associations and uses pattern recognition to learn and enhances student motivation by approaching pattern recognition from the designer s point of view A direct result of more than 10 years of teaching experience the text was developed by the authors through use in their own classrooms Approaches pattern recognition from the designer s point of view New edition highlights latest developments in this growing field including independent components and support vector machines not available elsewhere Supplemented by computer examples selected from applications of interest

The Elements of Statistical Learning
Trevor Hastie, Robert Tibshirani, Jerome Friedman, 2013-11-11 During the past decade there has been an explosion in computation and information technology With it have come vast amounts of data in a variety of fields such as medicine biology finance and marketing The challenge of understanding these data has led to the development of new tools in the field of statistics and spawned new areas such as data mining machine learning and bioinformatics Many of these tools have common underpinnings but are often expressed with different terminology This book describes the important ideas in these areas in a common conceptual framework While the approach is statistical the emphasis is on concepts rather than mathematics Many examples are given with a liberal use of color graphics It should be a valuable resource for statisticians and anyone interested in data mining in science or industry The book s coverage is broad from supervised learning prediction to unsupervised learning The many topics include neural networks support vector machines classification trees and boosting the first comprehensive treatment of this topic in any book This major new edition features many topics not covered in the original including graphical models random forests ensemble methods least angle regression path algorithms for the lasso non negative matrix factorization and spectral clustering There is also a chapter on methods for wide data p bigger than n including multiple testing and false discovery rates Trevor Hastie Robert Tibshirani and Jerome Friedman are professors of statistics at Stanford University They are prominent researchers in this area Hastie and Tibshirani developed generalized additive models and wrote a popular book of that title Hastie co developed much of the statistical modeling software and environment in R S PLUS and invented principal curves and surfaces Tibshirani proposed the lasso and is co author of the very successful An Introduction to the Bootstrap Friedman is the co inventor of many data mining tools including CART
