Bhatia,2015-02-18 An alternating current generator or AC generator produces an alternating current which means the voltage produced alternately reverses from positive to negative polarity producing a corresponding change in the direction of current flow Much like a DC generator an AC generator requires a coil to cut across the force lines of a magnetic field This coil is attached to two slip rings which deliver the current to and from the load destination thus completing the circuit Alternating current generators are often called Alternators The magnitude of AC voltage generated by an AC generator is dependent on 1 The strength of the magnetic field number of lines of force 2 The speed at which the loop rotates 3 The number of loops of wire that cut the magnetic field A rotation speed of 3000 revolutions per minute RPM produces 50 Hz and 3600 RPM produce 60 Hz The electric current in North American homes has a frequency of 60 hertz while in Europe it is 50 Hz An alternating current motor or AC motor uses electrical energy to produce motion and torque Very simple AC motors are called Squirrel cage motors these have only one or more stationary coils within which a special kind of mechanical rotor is free to rotate There is no electrical connection to the rotor from the outside Most AC motors require a starter or method of limiting the inrush current to a reasonable level Types of motor starting include reactive capacitor start and inductive start and electronic frequency drives and soft start drives The reactive start method is usually used on fractional horsepower motors and the electronic method is usually reserved for larger motors This 4 hr Quick Book provides a basic understanding of AC motors and generators explaining how to use them how to calculate power and determine torque considerations The course is based entirely on Naval Education and Training Materials NAVEDTRA 14177 Electricity and Electronic Training Series Module 5 and covers Chapter 3 and 4 titled Alternating Current Generators and Alternating Current Motors Learning Objective At the conclusion of this course the reader will be able to Describe the principle of magnetic induction as it applies to AC generators Describe the differences between the two basic types of AC generators Explain the factors that determine the maximum power output of an AC generator Describe the relationships between the individual output and resultant vectorial sum voltages in multiphase generators List the factors that determine the frequency and voltage of the alternator output Describe the purpose and procedure of parallel generator operation List three basic types of AC motors and describe the characteristics of each type Describe the characteristics of a series motor that enable it to be used as a universal motor State

the primary application of synchronous motors and explain the characteristics that make them suitable for that application Describe the features that make the AC induction motor the most widely used of electric motors Explain the operation of split phase windings in single phase AC induction motors Describe the effects of shaded poles in single phase AC induction motors

*The Analysis and Design of a High-power, High-efficiency Generator* Andre D. Brown, Leandro M. Lorilla, MIT/Industry Consortium on Advanced Automotive Electrical/Electronic Components and Systems, 2000 This report describes the analysis and optimized design of a wound field synchronous alternator for automotive applications The goal of the work described in this report is to develop a wound field synchronous alternator that meets the increased power and efficiency requirements set by the automotive industry The alternator must be capable of providing 4 kW at 600 rpm engine speed increasing linearly to 6 KW at 6000 rpm At an interior operating point of 1500 rpm and 3.25 W the alternator must be at least 75% efficient The alternator is connected to a three phase bridge rectifier to provide DC currents to the loads Beyond this the least expensive alternator is desired To reach this goal a lumped parameter model of the alternator is derived The alternator model is then connected to a simplified equivalent of the rectifier circuit with a constant voltage load which has been previously analyzed A computer based design engine is then used that employs a Monte Carlo synthesis and model based analysis process to optimize the alternator for cost The engine is exercised and the resulting optimized designs are presented below

Alternating-current Machine Design Theodore Torda, 1908 *John Deere New Generation and Generation II Tractors* John Dietz, 2011-01-15 In the 1960s and 1970s John Deere's tractors evolved dramatically from small machines into large powerful tractors with modern advances and muscular engines it was a period of the greatest changes since the 1920s Deere christened these tractors the New Generation This book in the Tractor Legacy series examines these Big Green machines in detail with archival and current photography of restored tractors a thorough historical text and details of model specifications and variations Alternators and Starter Motors Robert Bosch GmbH., 2003 *January 2023 - Surplus Record Machinery & Equipment Directory* Thomas C.
