No wonder, then, that from design to production, architecture too is becoming more and more subject to digital influences. The range of those influences stretches from the classical computer programs used in design and presentation to media-supported design processes all the way to computerized production techniques, to say nothing of industrialized bricklayer "robots." From measurement to planning and production, architecture is the product of a closely coordinated digital process chain. What influence do digital design digital design and production methods have on contemporary architecture? How are these methods changing architecture and the way it is created? Where does the potential of digital media for architecture lie? What are the areas in which every individual firm can begin to use them? What are the advantages of working electronically? How and at what cost can these methods be integrated into the day-to-day work of the professional architect? This publication offers answers to these and many other questions on all aspects of the digital design and construction process. The continuing trend toward market consolidation, the proliferation of sizes and nameplates, and the "need for speed" characterized this period, loosely labeled as the muscle car era. This is an exhaustive reference work to American made cars of model years 1960-1972. Organized by year (and summarizing the market annually), it provides a yearly update on each make's status and production figures, then details all models offered for that year. Model listings include available body styles, base prices, engine and transmission choices, power ratings, standard equipment, major options and their prices, curb weight and dimensions (interior and exterior), paint color choices, changes from the previous year's model, and sales figures. Also given are assembly plant locations and historical overviews of each model nameplate. The book is profusely illustrated with 1,018 photographs.
