Behaviour of Micro-organisms Jul 02 2024 Organisms are constantly being bombarded by stimuli in their envi ronment (and also by internal stimuli), and a common way of responding is by movement. This is an aspect of irritability, or excitability, or behaviour. Response to stimuli by movement is found in all organisms: it represents one of the universalities of biology. Yet at the molecular

level it is one of the least understood of biological phenomena. Micro-organisms are no exception. If motile, they respond to stimuli by active movement (taxis); if sessile, they respond by growth movements (tropisms). Responses by movement are known among micro-organisms to such stimuli as chemicals, electric current, gravity, light, temperature, touch, and vibrations. The behaviour of micro-organisms is an exciting subject, first of all for its own sake, but in addition because it may reveal facts and concepts that are applicable to understanding behaviour in more complicated organisms (even us) and because it may, help to understand the movement of cells and tissues during differentiation and development of higher plants and animals.

Characterization of Ten Microbial Isolates from Two Serpentinite Seamounts, Asùt Tesoru and Fantangisña, in the Mariana Forearc Apr 26 2021 The Mariana Forearc is home to the only known active serpentinite seamounts on Earth. Serpentinization, a reaction that occurs when ultramafic rock is exposed to water, fuels these unique environments. These seamounts are home to microbial communities that have barely begun to be explored; only one species of bacteria had been isolated and described prior to this research. During International Ocean Discovery Program Expedition 366, sediment samples were obtained from three seamounts. In this research, I characterized ten strains of bacteria

isolated at atmospheric pressure from samples obtained from two of the seamounts, Asùt Tesoru and Fantangisña. All of the isolates are closely related to previously cultured microbes and represent three genera: Halomonas, Demequina, and Marinobacter. These ten isolates were examined for pH tolerance, pressure tolerance, salinity requirement and tolerance, and temperature tolerance. The majority of these isolates were pressure-sensitive and alkaliphilic. The only previously characterized bacterium isolated from the seamounts, Marinobacter alkalphilus str ODP1200D-1.5, was obtained from the Japan Collection of Microorganisms, tested alongside the isolates, and sent for genome sequencing along with three of the isolates. Genomic analyses revealed several adaptations and metabolic capabilities that could contribute to survival in the seamounts, including Na+/H+ antiporters and acetate metabolism. The results of this research indicate that the characterized isolates could be active in situ, and therefore likely represent a portion of the active community at the seamounts. This thesis contributes to the knowledge of the microbial communities and adaptations required for life at serpentinite seamounts.

Biological Transformation of Wood by Microorganisms Jan 04 2022 This volume comprises the papers presented at the Session on Wood Products Pathology during the 2nd International Congress on Plant Pathology on 10th - 12th September 1973 in Minneapolis/USA. The topics were dealt with under four heads, viz. Interaction of Microorganisms during Wood Decay, Bacterial Degradation of Wood, Decay of Resistant Wood and Enzymatic Mechanisms of Deterioration Process, followed by a Discussion Session on Extension: an obli gation of all Wood Products Pathologists □. Thanks to the cooperation of the authors all the papers could be compiled in this volume. The conference gave an unique possibility to discuss in depth the principles of wood decay by microorganisms from the various angles. The chapters give detailed information on the current progress and problems in wood products pathology. They are therefore collected together in this volume so that people interested in this field will have immediate access to the material and ideas presented. The topic of this Session, the degradation of wood by fungi and bacteria, has become more and more important during the last years. Wood is the only renewable natural resource and raw material of man so that it must be preserved against unwanted deterioration. On the other hand, its natural decomposition does not lead to any harmful products but only to carbondioxide and water. Both aspects have been dealt with in this volume.
