Genetics and Genetic Engineering

Unit code:

TY30070010

QCF Level 3:

ETEC National

Credits value:

10

Guided learning hours: 60

■ Aims and purpose

The aim of this unit is to provide understanding of the principles of Mendelian genetics and Mendelian knowledge and practical techniques used in commercial, analytical and research laboratories.

■ Unit Introduction

To study genetics is to study the basis of life itself. Building on the knowledge of DNA structure which is covered in the Foundation and Intermediate Subsequent unit, this unit will enable learners to appreciate that genes control all of the characteristics of living organisms. Learners will also understand how the inheritance of cell division and chromosome replication lead to complex patterns of inheritance and mutation.

Students access to DNA knowledge can be used to learn more about molecular biology and genetics and control in fields such as forensic or forensic epidemiology, medicine for diagnosis and epidemiology. The tools and the knowledge now available allow manipulation of the blueprint of life and the creation of novel organisms. Current research is moving towards gene therapy which may relate to correction of genetic disease such as cystic fibrosis.

Learners will develop an understanding of the techniques at the heart of modern genetics and molecular biology – extracting DNA, PCR, sequencing, transforming cells and applying DNA using the polymerase chain reaction (PCR).

The cutting edge of genetics is moving forward at an extraordinary rate, allowing scientists to extend the applications. Examples can be found in many fields of forensic work, epidemiology in screening for disease and in research for cures. The ever-growing biotechnology industry depends heavily on the work of geneticists and molecular biologists to create both new products and the means to manufacture them.

Applications of genetics in agriculture include modified crops with enhanced nutritional value. Some that do so without the pests and disease. Environmental applications often be to help migration of species and programs, and to create, control, supply, from the soil.

Learners must also recognise the broader implications of their work. Learners are required to explore the impact of selected examples of genetic technology on society, safety and the ethical value of individuals and organisms.

Unit 18 Genetics And Genetic Engineering

Genetics and Genetic Engineering Tomas Cannon,2018-12-01 Genetics and Genetic Engineering explores the great discoveries in genetics the study of genes and the inherited information they contain Genetic engineering alters the genetic make up of an organism using techniques that remove heritable material or that introduce DNA prepared outside the organism either directly into the host or into a cell that is then fused or hybridized with the host This involves using recombinant nucleic acid DNA or RNA techniques to form new combinations of heritable genetic material followed by the incorporation of that material either indirectly through a vector system or directly through micro injection macro injection and micro encapsulation techniques Genetic engineering also called genetic modification is the direct manipulation of an organism s genes using biotechnology It is a set of technologies used to change the genetic makeup of cells including the transfer of genes within and across species boundaries to produce improved or novel organisms New DNA is obtained by either isolating or copying the genetic material of interest using recombinant DNA methods or by artificially synthesizing the DNA A construct is usually created and used to insert this DNA into the host organism The first recombinant DNA molecule was made by Paul Berg in 1972 by combining DNA from the monkey virus SV40with the lambda virus As well as inserting genes the process can be used to remove or e knock oute genes The new DNA can be inserted randomly or targeted to a specific part of the genome This book will prove equally useful for physicians nurses animal breeders and laboratory technicians in fact everyone whose daily work involves genetics and genetic engineering *A Closer Look at Genes and Genetic Engineering* Michael Anderson,2011-08-15 Introduces genes describes the structure of chromosomes and disorders that occur from mutations or alterations and discusses the practice and application of genetic engineering **Genetic Engineering** Jane K. Genetic Medicine Barton Childs, 2003-09-15 In Genetic Medicine A Logic of Disease Barton Childs demonstrates that knowledge of the ways both

genes and environment contribute to disease provides a rational basis for medical thinking This genetic medicine he explains should help the physician use the results of laboratory tests to perceive the uniqueness of the patient as well as that of the family and the cultural conditions in which the patient s condition arose Childs thus provides a conceptual framework within which to teach and practice a humane medicine [An Introduction to Genetic Engineering](#) Desmond S. T. Nicholl,2023-02-28 The fourth edition of this popular textbook retains its focus on the fundamental principles of gene manipulation providing an accessible and broad based introduction to the subject for beginning undergraduate students It has been brought thoroughly up to date with new chapters on the story of DNA and genome editing and new sections on bioethics significant developments in sequencing technology and structural functional and comparative genomics and proteomics and the impact of transgenic plants In addition to chapter summaries learning objectives concept maps glossary and key word lists the book now also features new concluding sections further reading lists and web search activities for each chapter to provide a comprehensive suite of learning resources to help students develop a flexible and critical approach to the study of genetic engineering
