

Chapter 18: Classification

I. Section I: The Importance of Classification

A. The Need for Systems

1. How many species have been named & classified by scientists?

1.7 million

2. What is **taxonomy**? **Classification of living organisms into different categories.**
3. Why do scientists use taxonomy to name & classify organisms?
To organize all living things; have a universal system of naming things.
4. What is the problem with using the common names of species? Give an example. **One organism may have several common names: EXAMPLE – cougar, puma, mountain lion, bob cat, jaguar, panther**
Or one common name may be used for several different organisms: EXAMPLE – The term “panther” may be used as the common name for several big cats.

B. Use the Internet to answer the following question:

- Who was Aristotle, where was he from & during what time period did he live? **Greek philosopher who lived from 384 – 322 BC.**
- How did Aristotle classify organisms? **According to where they lived &/or what characteristics they had. Plants were classified according to the type of stem they had (herbaceous vs. woody) & animals by where they lived (air, water, land). This got to be confusing because some organisms lived in several environments or plants had both types of stems.**
