**Genetics and Genomics of the Brassicaceae** Renate Schmidt, Ian Bancroft, 2010-12-03 The Genetics and Genomics of the Brassicaceae provides a review of this important family commonly termed the mustard family or Cruciferae The family contains several cultivated species including radish rocket watercress wasabi and horseradish in addition to the vegetable and oil crops of the Brassica genus There are numerous further species with great potential for exploitation in 21st century agriculture particularly as sources of bioactive chemicals

These opportunities are reviewed in the context of the Brassicaceae in agriculture. More detailed descriptions are provided of the genetics of the cultivated Brassica crops including both the species producing most of the brassica vegetable crops *B. rapa* and *B. oleracea* and the principal species producing oilseed crops *B. napus* and *B. juncea*. The Brassicaceae also include important model plant species. Most prominent is *Arabidopsis thaliana*, the first plant species to have its genome sequenced. Natural genetic variation is reviewed for *A. thaliana* as are the genetics of the closely related *A. lyrata* and of the genus *Capsella*. Self-incompatibility is widespread in the Brassicaceae and this subject is reviewed. Interest arising from both the commercial value of crop species of the Brassicaceae and the importance of *Arabidopsis thaliana* as a model species has led to the development of numerous resources to support research. These are reviewed including germplasm and genomic library resources and resources for reverse genetics, metabolomics, bioinformatics, and transformation. Molecular studies of the genomes of species of the Brassicaceae revealed extensive genome duplication indicative of multiple polyploidy events during evolution. In some species such as *Brassica napus* there is evidence of multiple rounds of polyploidy during its relatively recent evolution, thus the Brassicaceae represent an excellent model system for the study of the impacts of polyploidy and the subsequent process of diploidisation whereby the genome stabilises. Sequence level characterization of the genomes of *Arabidopsis thaliana* and *Brassica rapa* are presented along with summaries of comparative studies conducted at both linkage map and sequence level and analysis of the structural and functional evolution of resynthesised polyploids along with a description of the phylogeny and karyotype evolution of the Brassicaceae. Finally, some perspectives of the editors are presented. These focus upon the Brassicaceae species as models for studying genome evolution following polyploidy, the impact of advances in genome sequencing technology, prospects for future transcriptome analysis, and upcoming model systems.

Handbook of Image-Guided Brachytherapy Jyoti Mayadev, Stanley H. Benedict, Mitchell Kamrava, 2017-03-21. This handbook provides a clinically relevant, succinct and comprehensive overview of image-guided brachytherapy. Throughout the last decade, the utility of image guidance in brachytherapy has increased to enhance procedural development, treatment planning, and radiation delivery in an effort to optimize safety and clinical outcomes. Organized into two parts, the book discusses physics and radiobiology principles of brachytherapy as well as clinical applications of image-guided brachytherapy for various disease sites: central nervous system, eye, head and neck, breast, lung, gastrointestinal, genitourinary, gynecologic, sarcoma, and skin. It also describes the incorporation of imaging techniques such as CT, MRI, and ultrasound into brachytherapy procedures and planning. Featuring procedural and anesthesia care, extensive images, contouring examples, treatment planning techniques, and dosimetry for the comprehensive treatment of each disease site, *Handbook of Image-Guided Brachytherapy* is a valuable resource for practicing radiation oncologists, physicists, dosimetrists, residents, and medical students.

Kroening, 2004 *Lasso Peptides* Yanyan Li, Séverine Zirah, Sylvie Rebuffat, 2014-10-21 Lasso peptides form a growing family of fascinating ribosomally synthesized and post translationally modified peptides produced by bacteria They contain 15 to 24 residues and share a unique interlocked topology that involves an N terminal 7 to 9 residue macrolactam ring where the C terminal tail is threaded and irreversibly trapped The ring results from the condensation of the N terminal amino group with a side chain carboxylate of a glutamate at position 8 or 9 or an aspartate at position 7 8 or 9 The trapping of the tail involves bulky amino acids located in the tail below and above the ring and or disulfide bridges connecting the ring and the tail Lasso peptides are subdivided into three subtypes depending on the absence class II or presence of one class III or two class I disulfide bridges The lasso topology results in highly compact structures that give to lasso peptides an extraordinary stability towards both protease degradation and denaturing conditions Lasso peptides are generally receptor antagonists enzyme inhibitors and or antibacterial or antiviral anti HIV agents The lasso scaffold and the associated biological activities shown by lasso peptides on different key targets make them promising molecules with high therapeutic potential Their application in drug design has been exemplified by the development of an integrin antagonist based on a lasso peptide scaffold The biosynthesis machinery of lasso peptides is therefore of high biotechnological interest especially since such highly compact and stable structures have to date revealed inaccessible by peptide synthesis Lasso peptides are produced from a linear precursor LasA which undergoes a maturation process involving several steps in particular cleavage of the leader peptide and cyclization The post translational modifications are ensured by a dedicated enzymatic machinery which is composed of an ATP dependent cysteine protease LasB and a lactam synthetase LasC that form an enzymatic complex called lasso synthetase Microcin J25 produced by *Escherichia coli* AY25 is the archetype of lasso peptides and the most extensively studied To date only around forty lasso peptides have been isolated but genome mining approaches have revealed that they are widely distributed among Proteobacteria and Actinobacteria particularly in *Streptomyces* making available a rich resource of novel lasso peptides and enzyme machineries towards lasso topologies **Surgery for Pancreatic and Periampullary Cancer** Mallika Tewari, 2018-12-29 This book covers the full range of advanced surgical techniques for pancreatic and periampullary cancers with a focus on major and minor operative techniques and reconstruction methods Globally respected surgeons share their expertise and personal views in a how I do it manner supplemented by high quality illustrations Starting with initial chapters on surgical anatomy an overview of these cancers their classification and imaging subsequent chapters address surgical techniques for resection and reconstruction in detail The book also included dedicated chapters on complications preoperative and postoperative management protocols pathologic reporting and the impact of nutrition on the outcome

Divided into 28 chapters it provides an up to date practical guide to the diagnosis and management of pancreatic cancers for both young and experienced HPB and GI surgeons alike
