

Refer to your textbook pages 100-102 to complete the following summary of the Circulatory System.

Purpose and Function of the Circulatory System (Fill in the blanks using the terms below.)

valves exchange arteries veins contracts capillaries oxygen wastes nutrients

The function of the circulatory system is to transport _____ and _____ to cells and carry _____ away from cells to the organs responsible for eliminating them from the body.

The heart is a muscular pump. When the heart _____, it produces pressure on the blood in the circulatory system. This pressure pushes blood through the body. The blood travels away from the heart in vessels called _____. It returns to the heart through vessels called _____. To stop blood from flowing backwards, flexible flaps of tissue called _____ are found throughout the circulatory system in the heart and veins. Arteries and veins are connected by tiny, thin-walled vessels called _____. These very small vessels are in close contact with the organs and tissues of the body. The _____ of nutrients, wastes, oxygen and carbon dioxide occur between tissues and the blood through the walls of these small vessels.

Structure of the Heart: Refer to the Diagram on Page 100 to complete the labels of the heart.

Regulation of Tissue Oxygenation, Second Edition Roland N. Pittman, 2016-08-18 This presentation describes various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate ATP the energy currency of all cells The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4 5 mm Hg Thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂ In order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved

Regulation of Coronary Blood Flow Michitoshi Inoue, Masatsugu Hori, Shoichi Imai, Robert M. Berne, 2013-11-09 Research centering on blood flow in the heart continues to hold an important position especially since a better understanding of the subject may help reduce the incidence of coronary arterial disease and heart attacks This book summarizes recent advances in the field it is the product of fruitful cooperation among international scientists who met in Japan in May 1990 to discuss the regulation of coronary blood flow

The Complex Circulatory System Dr. Lainna Callentine, 2016-04-07 Developed by a pediatrician this book focuses on the amazing design and functionality of the human body's circulatory system You will discover amazing facts like The human heart beats 100 000 times a day and one drop of blood has 5 million red blood cells in it A timeline of important discoveries and innovators as well as key anatomical terms and concepts Discussions of disease and proper care for optimal health The third book in the popular elementary anatomy series God's Wondrous Machine focuses on the heart blood and blood vessels that make up the body's circulatory system Understanding the mechanics of this system in transporting nutrients blood chemicals and more to cells within the body is key to understanding how it helps fight disease as well as maintain a properly balanced temperature Readers learn how the

deliberate design of their bodies enables it to function as it should just as God meant for it to

Caffeine in Food and Dietary Supplements Leslie A. Pray, Institute of Medicine, Ann L. Yaktine, Food and Nutrition Board, Board on Health Sciences Policy, Diana E. Pankevich, Planning Committee for a Workshop on Potential Health Hazards Associated with Consumption of Caffeine in Food and Dietary Supplements, 2014 Caffeine in Food and Dietary Supplements is the summary of a workshop convened by the Institute of Medicine in August 2013 to review the available science on safe levels of caffeine consumption in foods beverages and dietary supplements and to identify data gaps Scientists with expertise in food safety nutrition pharmacology psychology toxicology and related disciplines medical professionals with pediatric and adult patient experience in cardiology neurology and psychiatry public health professionals food industry representatives regulatory experts and consumer advocates discussed the safety of caffeine in food and dietary supplements including but not limited to caffeinated beverage products and identified data gaps Caffeine a central nervous stimulant is arguably the most frequently ingested pharmacologically active substance in the world Occurring naturally in more than 60 plants including coffee beans tea leaves cola nuts and cocoa pods caffeine has been part of innumerable cultures for centuries But the caffeine in food landscape is changing There are an array of new caffeine containing energy products from waffles to sunflower seeds jelly beans to syrup even bottled water entering the marketplace Years of scientific research have shown that moderate consumption by healthy adults of products containing naturally occurring caffeine is not associated with adverse health effects The changing caffeine landscape raises concerns about safety and whether any of these new products might be targeting populations not normally associated with caffeine consumption namely children and adolescents and whether caffeine poses a greater health risk to those populations than it does for healthy adults This report delineates vulnerable populations who may be at risk from caffeine exposure describes caffeine exposure and risk of cardiovascular and other health effects on vulnerable populations including additive effects with other ingredients and effects related to pre existing conditions explores safe caffeine exposure levels for general and vulnerable populations and identifies data gaps on caffeine stimulant effects

The Cerebral Circulation Marilyn J. Cipolla, 2016-07-28. This book will review special features of the cerebral circulation and how they contribute to the physiology of the brain. It describes structural and functional properties of the cerebral circulation that are unique to the brain, an organ with high metabolic demands and the need for tight water and ion homeostasis. Autoregulation is pronounced in the brain with myogenic, metabolic, and neurogenic mechanisms contributing to maintain relatively constant blood flow during both increases and decreases in pressure. In addition, unlike peripheral organs where the majority of vascular resistance resides in small arteries and arterioles, large extracranial and intracranial arteries contribute significantly to vascular resistance in the brain. The prominent role of large arteries in cerebrovascular resistance helps maintain blood flow and protect downstream vessels during changes in perfusion pressure. The cerebral endothelium is also unique in that its barrier properties are in some way more like epithelium than endothelium in the periphery. The cerebral endothelium, known as the blood-brain barrier, has specialized tight junctions that do not allow ions to pass freely and has very low hydraulic conductivity and transcellular transport. This special configuration modifies Starling's forces in the brain microcirculation such that ions retained in the vascular lumen oppose water movement due to hydrostatic pressure. Tight water regulation is necessary in the brain because it has limited capacity for expansion within the skull. Increased intracranial pressure due to vasogenic edema can cause severe neurologic complications and death.
