**On Learning and Regularization in Super-Resolution Imaging** Muhammad Ali Muhammad Rushdi,2013 Advances in super resolution imaging have been made by reconstruction interpolation and example based algorithmic techniques drawn from the fields of signal and image processing machine learning biologically inspired computer vision and psychology However the performance of super resolution algorithms has been limited by constraints of sampling frequency sensor dimensions sensor noise focus and motion blurring and alignment between low resolution input data samples In this dissertation we propose several techniques to improve the performance of state of the art super resolution techniques Firstly a concise introduction and literature survey of super resolution imaging research is given Secondly novel dictionary learning techniques for super resolution are presented Thirdly non uniform image super resolution over deformed image domains is approached using patch redundancy as well as resolution independence image models Experimental results are good in visual quality and compare well with other state of the art techniques Future work should explore the extension of the proposed methods to video and stereoscopic imaging

*Deep Learning Based Image Super Resolution* Xiang Wang,2021 Image super resolution is one of the most significant computer vision researches aiming to reconstruct high resolution images with realistic details from low resolution images In the past years a number of traditional methods intended to produce high resolution images Recently Deep Convolutional Neural Networks DCNNs have developed rapidly and achieved impressive progress in the computer vision area Benefiting from DCNNs the performance of image super resolution has improved compared with traditional methods However there still exists a large gap between the results of current methods and the real world high resolution quality In this thesis we leverage the techniques of DCNNs to develop image super resolution models for generating satisfactory high resolution images There are several proposed methods in this thesis to satisfy different super resolution scenarios Our proposed methods are based on Generative Adversarial Networks GANs leading to powerful generative ability and effective discriminative learning To breakthrough current bottlenecks we design novel architectures for generator and discriminator and involve new optimization strategies to improve the learning stability of the models In order to improve the generalization ability of proposed methods we conduct two mainstream super resolution tasks namely face image hallucination and natural image super resolution All the proposed components of our methods result in promising super resolution performance for these tasks Not only handling the supervised super resolution task we also investigate the more challenging problem namely the unsupervised image super resolution task where the paired high resolution image and low resolution image data are unavailable To evaluate the performance of our methods in different scenarios we conduct extensive experiments on several benchmark datasets to study each method separately Compared to state of the art methods our methods are able to achieve superior performance both quantitatively and qualitatively
