Chemistry of Hydrocarbon Combustion David. Hucknall, 2012-12-06 The scientific and economic importance of the high temperature reactions of hydrocarbons in both the presence and absence of oxygen cannot be overemphasized A vast chemical industry exists based on feedstocks produced by the controlled pyrolysis of hydrocarbons while uncontrolled combustion in air is still among the most important sources of heat and mechanical energy The detonation and explosion of hydrocarbon oxidant mixtures can however be a highly dangerous phenomenon which destroys lives and equipment In order that control can be exerted over combustion processes a complete description of hydrocarbon oxidation and pyrolysis is required A major contribution to this is an understanding of the unstable intermediates involved and their reactions The aim of this book is to review our knowledge of the chemistry of hydrocarbon combustion and to consider the data which are available for relevant reactions Chapter 1 describes early studies in which the apparent complexity of the chemistry was established and the type of information required for a better understanding was defined Experimental studies of the overall process which were carried out with the aim of establishing the sequence of stable chemical intermediates and some of the unstable species are described in Chapter 2 The limited nature of the information thus obtained showed that independent studies of individual reactions involving the unstable species were required In Chapter 3 investigations specifically aimed at the determination of the kinetics of elementary reactions are discussed

*Hydrocarbon Chemistry* George A. Olah, Árpád Molnár, 2003-09-24 Hydrocarbons and their transformations play major roles in chemistry as raw materials and sources of energy. Diminishing petroleum supplies, regulatory problems and environmental concerns constantly challenge chemists to rethink and redesign the industrial applications of hydrocarbons. Written by Nobel Prize winner George Olah and hydrocarbon expert Árpád Molnár, the completely revised and expanded Second Edition of *Hydrocarbon Chemistry* provides an unparalleled contemporary assessment of the field, presenting basic concepts, current research and future applications. *Hydrocarbon Chemistry* begins by discussing the general aspects of hydrocarbons, the separation of hydrocarbons from natural sources and the synthesis from C1 precursors with recent developments for possible future applications. Each successive chapter deals with a specific type of hydrocarbon transformation. The Second Edition includes a new section on the chemical reduction of carbon dioxide, focusing on catalytic, ionic, electrocatalytic, photocatalytic and enzymatic reductions, as well as a new chapter on new catalysts and activation methods, combinatorial chemistry and environmental chemistry. Other topics covered include major processes of the petrochemical industry such as cracking, reforming, isomerization and alkylation; Derivation reactions to form carbon-heteroatom bonds; Hydrocarbon oxidations; Metathesis; Oligomerization and polymerization of hydrocarbons. All chapters have been updated by adding sections on recent developments to review new advances and results. Essential reading for practicing scientists in industry, polymer and catalytic chemists, as well as researchers and graduate students. *Hydrocarbon Chemistry* Second Edition remains the benchmark text in its field.
