Modeling, Identification and Control of Robots W. Khalil,E. Dombre,2004-07-01 Written by two of Europe s leading robotics experts this book provides the tools for a unified approach to the modelling of robotic manipulators whatever their mechanical structure No other publication covers the three fundamental issues of robotics modelling identification and control It covers the development of various mathematical models required for the control and simulation of robots World class authority Unique range of coverage not available in any other book Provides a complete course on robotic control at an undergraduate and graduate level

Legged Robots that Balance Marc H. Raibert,1986 This book by a leading authority on legged locomotion presents exciting engineering and science along with fascinating implications for theories of human motor control It lays fundamental groundwork in legged locomotion one of the least developed areas of robotics addressing the possibility of building useful legged robots that run and balance The book describes the study of physical machines that run and balance on just one leg including analysis computer simulation and laboratory experiments Contrary to expectations it reveals that control of such machines is not particularly difficult It describes how the principles of locomotion discovered with one leg can be extended to systems with several legs and reports preliminary experiments with a quadruped machine that runs using these principles

Raibert's work is unique in its emphasis on dynamics and active balance aspects of the problem that have played a minor role in most previous work. His studies focus on the central issues of balance and dynamic control while avoiding several problems that have dominated previous research on legged machines. Marc Raibert is Associate Professor of Computer Science and Robotics at Carnegie Mellon University and on the editorial board of The MIT Press journal *Robotics Research*. *Legged Robots That Balance* is fifteenth in the Artificial Intelligence Series edited by Patrick Winston and Michael Brady.

Dynamic Stabilisation of the Biped Lucy Powered by Actuators with Controllable Stiffness Bram

Vanderborght, 2010-09-07 This book reports on the developments of the bipedal walking robot Lucy. Special about it is that the biped is not actuated with the classical electrical drives but with pleated pneumatic artificial muscles. In an antagonistic setup of such muscles both the torque and the compliance are controllable. From human walking there is evidence that joint compliance plays an important role in energy efficient walking and running. Moreover pneumatic artificial muscles have a high power to weight ratio and can be coupled directly without complex gearing mechanism which can be beneficial towards legged mechanisms. Additionally they have the capability of absorbing impact shocks and store and release motion energy. This book gives a complete description of Lucy: the hardware, the electronics and the software. A hybrid simulation program combining the robot dynamics and muscle valve thermodynamics has been written to evaluate control strategies before implementing them in the real biped. *Stability Optimization of Open Loop Controlled Walking Robots* Katja D.

Mombaur, 2002 Modeling, Simulation and Optimization of Bipedal Walking Katja Mombaur, Karsten Berns, 2013-02-28 The model based investigation of motions of anthropomorphic systems is an important interdisciplinary research topic involving specialists from many fields such as Robotics, Biomechanics, Physiology, Orthopedics, Psychology, Neurosciences, Sports, Computer Graphics and Applied Mathematics. This book presents a study of basic locomotion forms such as walking and running is of particular interest due to the high demand on dynamic coordination, actuator efficiency and balance control. Mathematical models and numerical simulation and optimization techniques are explained in combination with experimental data which can help to better understand the basic underlying mechanisms of these motions and to improve them. Example topics treated in this book are: Modeling techniques for anthropomorphic bipedal walking systems, Optimized walking motions for different objective functions, Identification of objective functions from measurements, Simulation and optimization approaches for humanoid robots, Biologically inspired control algorithms for bipedal walking, Generation and deformation of natural walking in computer graphics, Imitation of human motions on humanoids, Emotional body language during walking, Simulation of biologically inspired actuators for bipedal walking machines, Modeling and simulation techniques for the development of prostheses, Functional electrical stimulation of walking. Fast Motions in Biomechanics and Robotics

Moritz Diehl, Katja Mombaur, 2007-07-13 In the past decades much progress has been made in the field of walking robots. The current state of technology makes it possible to create humanoid robots that nearly walk like a human being climb stairs or

avoid small stacles However the dream of a robot running as fast and as elegantly as a human is still far from becoming reality Control of such fast motions is still a big technological issue in robotics and the maximum running speed of contemporary robots is still much smaller than that of human track runners The conventional control approach that most of these robots are based on does not seem to be suitable to increase the running speeds up to a biological level In order to address this challenge we invited an interdisciplinary community of researchers from robotics biomechanics control engineering and applied mathematics to come together in Heidelberg at the Symposium Fast Motions in Biomechanics and Robotics Optimization Feedback Control which was held at the International Science Forum IWH on September 7 9 2005 The number of participants in this symposium was kept small in order to promote discussions and enable a fruitful exchange of ideas

Human Centered Robot Systems Helge Ritter, Gerhard Sagerer, Rüdiger Dillmann, Martin Buss, 2009-11-25 Human Centered Robotic Systems must be able to interact with humans such that the burden of adaptation lies with the machine and not with the human This book collates a set of prominent papers presented during a two day conference on Human Centered Robotic Systems held on November 19 20 2009 in Bielefeld University Germany The aim of the conference was to bring together researchers from the areas of robotics computer science psychology linguistics and biology who are all focusing on a shared goal of cognitive interaction A survey of recent approaches the current state of the art and possible future directions in this interdisciplinary field is presented It provides practitioners and scientists with an up to date introduction to this dynamic field with methods and solutions that are likely to significantly impact on our future lives

Coordination Control of Distributed Systems Jan H. van Schuppen, Tiziano Villa, 2014-09-25 This book describes how control of distributed systems can be advanced by an integration of control communication and computation The global control objectives are met by judicious combinations of local and nonlocal observations taking advantage of various forms of communication exchanges between distributed controllers Control architectures are considered according to increasing degrees of cooperation of local controllers fully distributed or decentralized control control with communication between controllers coordination control and multilevel control The book covers also topics bridging computer science communication and control like communication for control of networks average consensus for distributed systems and modeling and verification of discrete and of hybrid systems Examples and case studies are introduced in the first part of the text and developed throughout the book They include control of underwater vehicles automated guided vehicles on a container terminal control of a printer as a complex machine and control of an electric power system The book is composed of short essays each within eight pages including suggestions and references for further research and reading By reading the essays collected in the book Coordination Control of Distributed Systems graduate students and post docs will be introduced to the research frontiers in control of decentralized and of distributed systems Control theorists and practitioners with backgrounds in electrical mechanical civil and aerospace engineering will find in the book information and inspiration to transfer to their
