The Cardiovascular System

The major structures of the cardiovascular system, the heart and blood vessels, play a vital role in human physiology. The major function of the cardiovascular system is transportation. Using blood as the transport vehicle, the system carries nutrients, gases, wastes, antibodies, electrolytes, and many other substances to and from body cells. Its propulsive force is the contracting heart.

The anatomy and location of the heart and blood vessels and the important understandings of cardiovascular physiology (for example, cardiac cycle, ECG, and regulation of blood pressure) are the major topics of this chapter.

CARDIOVASCULAR SYSTEM: THE HEART

1. Complete the following statements by inserting your answers in the answer blanks.

1. thorax
2. diaphragm
3. second
4. aorta
5. right atrium
6. atria
7. ventricles
8. endocardium
9. epicardium
10. friction
11. cardiac muscle

The heart is a cone-shaped muscular organ located within the (1). Its apex rests on the (2), and its base is at the level of the (3) rib. The coronary arteries that nourish the myocardium arise from the (4). The coronary sinus empties into the (5). Relative to the roles of the heart chambers, the (6) are receiving chambers, whereas the (7) are discharging chambers. The membrane that lines the heart and also forms the valve flaps is called the (8). The outermost layer of the heart is called the (9). The fluid that fills the pericardial sac acts to decrease (10) during heart activity. The heart muscle, or myocardium, is composed of a specialized type of muscle tissue called (11).

Anatomy and Physiology J. Gordon Betts, Peter DeSaix, Jody E. Johnson, Oksana Korol, Dean H. Kruse, Brandon Poe, James A. Wise, Mark Womble, Kelly A. Young, 2013-04-25 Regulation of Tissue Oxygenation, Second Edition Roland N.

Pittman, 2016-08-18 This presentation describes various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate ATP the energy currency of all cells The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4.5 mm Hg Thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂ In order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved

Public Health

Service. Office of the Surgeon General,2010 This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke Many Surgeon General s reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies Mechanisms of disease are important because they may provide plausibility which is one of the guideline criteria for assessing evidence on causation This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke This evidence is relevant to understanding how smoking causes disease to identifying those who may be particularly susceptible and to assessing the potential risks of tobacco products
