Low Power VCO Design in CMOS
Marc Tiebout, 2006-01-25 This work covers the design of CMOS fully integrated low power low phase noise voltage controlled oscillators for telecommunication or datacommunication systems The need for low power is obvious as mobile wireless telecommunications are battery operated As wireless telecommunication systems use oscillators in frequency synthesizers for frequency translation the selectivity and signal to noise ratio of receivers and transmitters depend heavily on the low phase noise performance of the implemented oscillators Datacommunication systems need low jitter the time domain equivalent of low phase noise clocks for data detection and recovery The power consumption is less critical The need for multi band and multi mode systems pushes the high integration of telecommunication systems This is offered by sub micron CMOS featuring digital exibility The recent crisis in telecommunication clearly shows that mobile hand sets became mass market high volume consumer products where low cost is of prime importance This need for low cost products livens tremendously research towards CMOS alternatives for the bipolar or BiCMOS solutions in use today

Computational Optimization, Methods and Algorithms
Slawomir Koziel, Xin-She Yang, 2011-06-17 Computational optimization is an important paradigm with a wide range of applications In virtually all branches of engineering and industry we almost always try to optimize something whether to minimize the cost and energy consumption or to maximize profits outputs performance and efficiency In many cases this search for optimality is challenging either because of the high computational cost of evaluating objectives and constraints or because of the nonlinearity multimodality discontinuity and uncertainty of the problem functions in the real world systems Another complication is that most problems are often NP hard that is the solution time for finding the optimum increases exponentially with the problem size The development of efficient algorithms and specialized techniques that address these difficulties is of primary importance for contemporary engineering science and industry This book consists of 12 self contained chapters contributed from worldwide experts who are working in these exciting areas The book strives to

review and discuss the latest developments concerning optimization and modelling with a focus on methods and algorithms for computational optimization. It also covers well chosen real world applications in science, engineering and industry. Main topics include derivative free optimization, multi objective evolutionary algorithms, surrogate based methods, maximum simulated likelihood estimation, support vector machines and metaheuristic algorithms. Application case studies include aerodynamic shape optimization, microwave engineering, black box optimization, classification, economics, inventory optimization and structural optimization. This graduate level book can serve as an excellent reference for lecturers, researchers and students in computational science, engineering and industry.

Frequency Selective Surfaces Ben A. Munk, 2005-03-11. Ben has been the world wide guru of this technology providing support to applications of all types. His genius lies in handling the extremely complex mathematics while at the same time seeing the practical matters involved in applying the results. As this book clearly shows, Ben is able to relate to novices interested in using frequency selective surfaces and to explain technical details in an understandable way, liberally spiced with his special brand of humor. Ben Munk has written a book that represents the epitome of practical understanding of Frequency Selective Surfaces. He deserves all honors that might befall him for this achievement.

William F. Bahret, Mr. W. Bahret was with the United States Air Force but is now retired. From the early 50s he sponsored numerous projects concerning Radar Cross Section of airborne platforms in particular antennas and absorbers. Under his leadership grew many of the concepts used extensively today, as for example the metallic radome. In fact, he is by many considered to be the father of stealth technology. This book compiles under one cover most of Munk's research over the past three decades. It is woven with the physical insight that he has gained and further developed as his career has grown. Ben uses mathematics to whatever extent is needed and only as needed. This material is written so that it should be useful to engineers with a background in electromagnetics. I strongly recommend this book to any engineer with any interest in phased arrays and/or frequency selective surfaces. The physical insight that may be gained from this book will enhance their ability to treat additional array problems of their own.

Leon Peters Jr, Professor Leon Peters Jr was a professor at the Ohio State University but is now retired. From the early sixties he worked on among many other things RCS problems involving antennas and absorbers. This book presents the complete derivation of the Periodic Method of Moments which enables the reader to calculate quickly and efficiently the transmission and reflection properties of multi layered Frequency Selective Surfaces comprised of either wire and/or slot elements of arbitrary shape and located in a stratified medium. However, it also gives the reader the tools to analyze multi layered FSS's leading to specific designs of the very important Hybrid Radome which is characterized by constant band width with angle of incidence and polarization. Further, it investigates in great detail bandstop filters with large as well as narrow bandwidth dichroic surfaces. It also discusses for the first time lossy elements used in producing Circuit Analog absorbers. Finally, the last chapter deals with power breakdown of FSS's when exposed to pulsed signals with high peak power. The approach followed by most other

presentations simply consists of expanding the fields around the FSS matching the boundary conditions and writing a computer program While this enables the user to obtain calculated results it gives very little physical insight and no help in how to design actual multi layered FSS s In contrast the approach used in this title analyzes all curves of desired shapes In particular it discusses in great detail how to produce radomes made of FSS s located in a stratified medium Hybrid Radomes with constant band width for all angles of incidence and polarizations Numerous examples are given of great practical interest More specifically Chapter 7 deals with the theory and design of bandpass radomes with constant bandwidth and flat tops Examples are given for mono bi and tri planar designs Chapter 8 deals with bandstop filters with broad as well as narrow bandwidth Chapter 9 deals with multi layered FSS of lossy elements namely the so called Circuit Analog Absorbers designed to yield outstanding absorption with more than a decade of bandwidth Features material previously labeled as classified by the United States Air Force

Brain and Human Body Modeling Sergey Makarov, Marc Horner, Gregory Noetscher, 2019-08-27 This open access book describes modern applications of computational human modeling with specific emphasis in the areas of neurology and neuroelectromagnetics depression and cancer treatments radio frequency studies and wireless communications Special consideration is also given to the use of human modeling to the computational assessment of relevant regulatory and safety requirements Readers working on applications that may expose human subjects to electromagnetic radiation will benefit from this book s coverage of the latest developments in computational modelling and human phantom development to assess a given technology s safety and efficacy in a timely manner Describes construction and application of computational human models including anatomically detailed and subject specific models Explains new practices in computational human modeling for neuroelectromagnetics electromagnetic safety and exposure evaluations Includes a survey of modern applications for which computational human models are critical Describes cellular level interactions between the human body and electromagnetic fields
