Developing and Leading Emergence Teams Peter A.C. Smith, Tom Cockburn, 2016-03-10 Developing and Leading Emergence Teams describes a future business landscape that seems to be complicated complex and chaotic in almost equal measures The variety and diversity of the environments within which large organizations will be seeking to operate require a similar variety of systems process and structures if they are to respond successfully to emerging opportunities The established models of teamworking matrix cross functional or transdisciplinary can all adapt to this new environment but will only do so if the culture leadership and management style of the business enables this The authors describe a model of emergence teams high trust teams that exhibit exceptional affinity for knowledge sharing sense making and consensus building They then explore the specifics of leading such a team how the team leader should design the team interact and facilitate the team s development understand the personal nature of each of the team members and the overall emotional regime that will affect trust commitment and motivation Peter Smith and Tom Cockburn draw on research and detailed case examples to provide techniques your organization can adopt in order to build and support the various teams capable of addressing complexity

Mammalian Dispersal Patterns B. Diane Chepko-Sade, Zuleyma Tang Halpin, 1987 Mammalian Dispersal Patterns examines the ways that social structure affects population genetics and in turn rates of evolution in mammalian groups It brings together fieldwork in animal behavior and wildlife biology with theoretical work in demography and population genetics The focus here is dispersal whether how and when individuals leave the areas where they are born Theoretical work in population genetics indicates that such social factors as skewed sex ratios restrictive mating patterns and delayed age of first reproduction will lower the reproductive variability of a population by reducing the number of genotypes passed from one generation to the next Field studies have shown that many mammalian species do exhibit many such social characteristics Among horses elephant seals and a number of primates the majority of females are inseminated by only a fraction of the males In packs of wolves and mongooses usually only the highest ranking male and female breed in a given season Although socially restricted mating tends to lower genetic variability in isolated populations it actually tends to increase genetic variability in subdivided populations with low rates of migration between subunits Among some species there is little dispersal and thus little gene flow between subpopulations other species travel far afield before mating The contributors to this volume examine actual data from populations of mammals the way patterns of dispersal correlate with the genetic structure of individuals and populations and mathematical models of population structure This interdisciplinary approach has an important bearing on work in conservation of both wildlife and zoo populations for it shows that the home range and the population size needed to maintain genetic variability can differ greatly from one species to the next The volume also offers a fruitful model for future research
