This two volume set (LNCS 8025-8026) constitutes the refereed proceedings of the Fourth International Conference on Digital Human Modeling and Applications in Health, Safety, Ergonomics and Risk Management, formerly International Conference on Digital Human Modeling, DHM 2013, held as part of the 15th International Conference on Human-Computer Interaction, HCII 2013, held in Las Vegas, USA in July 2013, jointly with 12 other thematically similar

conferences. The total of 1666 papers and 303 posters presented at the HCII 2013 conferences was carefully reviewed and selected from 5210 submissions. These papers address the latest research and development efforts and highlight the human aspects of design and use of computing systems. The papers accepted for presentation thoroughly cover the entire field of Human-Computer Interaction, addressing major advances in knowledge and effective use of computers in a variety of application areas. This two-volume set contains 91 papers. The papers in this volume focus on the following topics: digital human modeling

and ergonomics in working environments; ergonomics of work with computers; anthropometry, posture and motion modeling. On July 20, 1969, US astronauts Neil Armstrong and Buzz Aldrin became the first men to walk on the moon. The Apollo 11 mission that carried them and fellow astronaut Michael Collins on their epic journey marked the successful culmination of a quest that, ironically, had begun in Nazi Germany thirty years before. This is the story of the Apollo 11 mission and the 'space hardware' that made it all possible. Author Chris Riley looks at the evolution and design of the mighty Saturn V

rocket, the Command and Service Modules, and the Lunar Module. He also describes the space suits worn by the crew, with their special life support systems. Launch procedures are described, 'flying' the Saturn V, navigation, course correction 'burns', orbital rendezvous techniques, flying the LEM, moon landing, moon walk, take-off from the moon, and earth re-entry procedure. Includes performance data, fuels, biographies of Armstrong, Aldrin and Collins, Gene Kranz and Werner von Braun. Detailed appendices cover all of the Apollo missions, with full details of crews, spacecraft names and logos, mission

priorities, moon landing sites, and the Lunar Rover. Popular Mechanics inspires, instructs and influences readers to help them master the modern world. Whether it's practical DIY home-improvement tips, gadgets and digital technology, information on the newest cars or the latest breakthroughs in science -- PM is the ultimate guide to our high-tech lifestyle. Models covered: VW Golf, GTI, Jetta and Cabrio 1999 through 2002. The only complete new-car buying guide, this new edition covers more than 190 passenger cars, minivans, pickup trucks, and sport utility vehicles for 2001. Includes profiles and photos of new models, the latest suggested

retail and dealer-invoice prices for all models and options, mileage ratings, warranty information, and more. Signet Special Oversize. In the rapid evolution of Mac OS X, there have been three major releases in three short years. Each new release has challenged power users to stay ahead of the learning curve-and Mac OS X Panther is by no means an exception. Apple's own documentation gives clues to parts of the puzzle, but until now, there hasn't been a comprehensive resource that charts the internals of the system. Running Mac OS X Panther is the book that Mac power users have been craving. Author James Duncan Davidson

takes you deep inside Mac OS X's core and shows you how to make Panther purr like nothing else. This book isn't just for those who want to use Mac OS X, but for those who feel the need to customize, tweak, and dissect Mac OS X. The book covers such topics as: Setting up user accounts for humans and non-humans; Scheduling tasks and monitoring your system; Using HFS+ and the Journaled filesystem used by Panther; Tweaking preferences by hacking plist files or using the defaults command; Opening Directory and Directory Services, including NetInfo and LDAP; Handling printer configuration and printing; Managing networking

and network services, including Rendezvous and wireless AirPort networks. The appendix includes juicy details about such things as installing Panther, plus a listing of resources for Mac users and power users alike. Written for readers who are inquisitive and confident enough to dig into their Macintosh system, *Running Mac OS X Panther* doesn't waste time talking about silly Finder tricks. This book dives right in and explains how Mac OS X works. If you're not a Mac guru when you start reading this book, you will be by the time you finish it. James Duncan Davidson found the Mac religion toward the end of his post at Sun Microsystems.

He is a freelance author, speaker, and software consultant, focusing on Mac OS X, Cocoa, java, and XML. This book constitutes the proceedings of the 10th International Workshop on Algorithms and Computation, WALCOM 2016, held in Kathmandu, Nepal, in March 2016. The 27 full papers presented together with 4 invited talks were carefully reviewed and selected from 68 submissions. The papers cover a wide range of topics such as approximation algorithms, computational complexity, computational geometry, data structures, graph algorithms, graph coloring, graph exploration, and online

algorithms. *Orbital Mechanics for Engineering Students*, Second Edition, provides an introduction to the basic concepts of space mechanics. These include vector kinematics in three dimensions; Newton's laws of motion and gravitation; relative motion; the vector-based solution of the classical two-body problem; derivation of Kepler's equations; orbits in three dimensions; preliminary orbit determination; and orbital maneuvers. The book also covers relative motion and the two-impulse rendezvous problem; interplanetary mission design using patched conics; rigid-body dynamics used to characterize the

attitude of a space vehicle; satellite attitude dynamics; and the characteristics and design of multi-stage launch vehicles. Each chapter begins with an outline of key concepts and concludes with problems that are based on the material covered. This text is written for undergraduates who are studying orbital mechanics for the first time and have completed courses in physics, dynamics, and mathematics, including differential equations and applied linear algebra. Graduate students, researchers, and experienced practitioners will also find useful review materials in the book. **NEW:** Reorganized and improved discussions of

coordinate systems, new discussion on perturbations and quaternions **NEW:** Increased coverage of attitude dynamics, including new Matlab algorithms and examples in chapter 10 New examples and homework problems These proceedings showcase the best papers selected from more than 500 submissions, introducing readers to the top research topics and the latest developmental trends in the theory and application of Man-Machine-Environment System Engineering (MMESE). This research topic was first established in China by Professor Shengzhao Long in 1981, with direct support from

one of the greatest modern Chinese scientists, Xuesen Qian. In a letter to Shengzhao Long from October 22nd, 1993, Xuesen Qian wrote: "You have created a very important modern science and technology in China!" MMESE primarily focuses on the relationship between Man, Machine and Environment, studying the optimum combination of related Man-Machine-Environment systems. In this paradigm, "Man" refers to working people as the subject at the workplace (e.g. operators, decision-makers); "Machine" is the general name for any object controlled by Man (including tools, machinery, computers, systems

and technologies), and "Environment" describes the specific working conditions under which Man and Machine interact (e.g. temperature, noise, vibration, hazardous gases etc.). In turn, the three goals of optimization are to ensure safety, efficiency and economy in this context. These proceedings present interdisciplinary studies on the concepts and methods of physiology, psychology, system engineering, computer science, environmental science, management, education, and other related disciplines. They offer a valuable resource for all researchers and professionals whose work involves interdisciplinary areas touching

on MMESE subjects. In March 2005, the NASA History Division and the Division of Space History at the National Air and Space Museum brought together a distinguished group of scholars to consider the state of the discipline of space history. This volume is a collection of essays based on those deliberations. The meeting took place at a time of extraordinary transformation for NASA, stemming from the new Vision of Space Exploration announced by President George W. Bush in January 2004: to go to the Moon, Mars, and beyond. This Vision, in turn, stemmed from a deep reevaluation of NASA's goals in the wake of the Space

Shuttle Columbia accident and the recommendations of the Columbia Accident Investigation Board. The new goals were seen as initiating a "New Age of Exploration" and were placed in the context of the importance of exploration and discovery to the American experiences. (Amazon). The Explosion and fire at the Buncefield Oil Storage Depot involved 22 tanks. The main fires were extinguished in three days but the overall fire response lasted 26 days and 642 fire appliances were moved to the incident. This report sets out the chronological sequence of events and reviews the fire response. It covers pre-planning and pre-training; the

response of the Hertfordshire Fire and Rescue Service; the response by other fire provider and supporting organisations; and presents the learning points of local, national, and international significance, which are drawn both from good practice at the incident and the areas that could have been improved. This 2002 edition of the only complete new-car buying guide includes profiles and photos of new models, retail and dealer invoice prices, mileage ratings, warranties, and safety features. Also includes consumer tips on shopping, leasing, lemon laws, insurance, and much more. This book follows a recipe-based approach that will

heavily focus on the code and how to integrate the samples with the reader's projects. Each recipe consists of one or more methods that you can put directly into your app and use. This book is ideal for developers that want to create network applications for the Apple OS X or iOS platforms. All examples are written in Objective-C using XCode as the IDE. Knowledge of Objective-C and X-Code is essential. Publishes in-depth articles on labor subjects, current labor statistics, information about current labor contracts, and book reviews. The ultimate command reference for configuring Cisco "RM" routers and switches. This guide

presents the common elements of complex configurations for Cisco "RM" routers, switches, and firewalls in an intuitive, easy-to-reference format. This SpringerBrief summarizes the development of Distributed Hash Table in both academic and industrial fields. It covers the main theory, platforms and applications of this key part in distributed systems and applications, especially in large-scale distributed environments. The authors teach the principles of several popular DHT platforms that can solve practical problems such as load balance, multiple replicas, consistency and latency. They also propose DHT-based applications

including multicast, anycast, distributed file systems, search, storage, content delivery network, file sharing and communication. These platforms and applications are used in both academic and commercial fields, making Distributed Hash Table a valuable resource for researchers and industry professionals. This book combines Apple's trademark visual elegance with the underlying stability of UNIX, which adds up to a rock-solid operating system. Pogue covers each of the control panels and bonus programs that come with Mac OS X, including iTunes, Mail, Sherlock, and Apache, the built-in Web-server. The

Gemini space flight program is all but forgotten, having been eclipsed by the spectacular drama and success of the Apollo flights to the Moon. Neither was it a pioneer, coming after the heroic and pathfinding Mercury project. But whereas Mercury was derided as 'spam-in-a-can' and Apollo was a truck towing a lunar lander, the Gemini spacecraft was an agile flying machine for fighter pilots. Initially called the Mercury Mark II, it gave the United States the tool it needed to learn how to fly in space, and in so doing it prepared the country's space agency, NASA, to set off for the Moon. An introduction to the engineering

principles of embedded systems, with a focus on modeling, design, and analysis of cyber-physical systems. The most visible use of computers and software is processing information for human consumption. The vast majority of computers in use, however, are much less visible. They run the engine, brakes, seatbelts, airbag, and audio system in your car. They digitally encode your voice and construct a radio signal to send it from your cell phone to a base station. They command robots on a factory floor, power generation in a power plant, processes in a chemical plant, and traffic lights in a city. These less visible computers

are called embedded systems, and the software they run is called embedded software. The principal challenges in designing and analyzing embedded systems stem from their interaction with physical processes. This book takes a cyber-physical approach to embedded systems, introducing the engineering concepts underlying embedded systems as a technology and as a subject of study. The focus is on modeling, design, and analysis of cyber-physical systems, which integrate computation, networking, and physical processes. The second edition offers two new chapters, several new exercises, and other

improvements. The book can be used as a textbook at the advanced undergraduate or introductory graduate level and as a professional reference for practicing engineers and computer scientists. Readers should have some familiarity with machine structures, computer programming, basic discrete mathematics and algorithms, and signals and systems. This book constitutes the refereed proceedings of the 4th International Symposium on Mobile Human-Computer Interaction, Mobile HCI 2002, held in Pisa, Italy, in September 2002. The revised 18 full papers and 32 short papers presented together with 2 invited contributions were

carefully reviewed and selected from numerous submissions. The book offers topical sections on location awareness, design support for personal digital assistants, context dependent systems, innovative case studies, usability evaluation in small devices, and novel user interfaces for mobile devices. Cincinnati Magazine taps into the DNA of the city, exploring shopping, dining, living, and culture and giving readers a ringside seat on the issues shaping the region. The European Space Agency has a long history of human spaceflight, flying in space with both NASA and the Soviet/Russian space agencies over the years. This book tells

the story of the ESA astronauts who have visited the International Space Station over its first decade and how they have lived on board, helped construct the space laboratory and performed valuable scientific experiments. ESA has contributed the Columbus science laboratory as well as the Copula, the Leonardo PMM and the ATV supply ship to the station's infrastructure but it is the human endeavor that captures the imagination. From brief visits to six month expeditions, from spacewalking to commanding the Earth's only outpost in space, ESA astronauts have played a vital role in the international

project. Extensive use of color photographs from NASA and ESA depicting the experiments carried out, the phases of the ISS construction and the personal stories of the astronauts in space highlights the crucial European work on human spaceflight. In scientific computing (also known as computational science), advanced computing capabilities are used to solve complex problems. This self-contained book describes and analyzes reported software failures related to the major topics within scientific computing: mathematical modeling of phenomena; numerical analysis (number representation, rounding,

conditioning); mathematical aspects and complexity of algorithms, systems, or software; concurrent computing (parallelization, scheduling, synchronization); and numerical data (such as input of data and design of control logic). Readers will find lists of related, interesting bugs, MATLAB examples, and “excursions” that provide necessary background, as well as an in-depth analysis of various aspects of the selected bugs. Illustrative examples of numerical principles such as machine numbers, rounding errors, condition numbers, and complexity are also included. The second edition of *Centered* offers movement practitioners
