Time Series: Theory and Methods Peter J. Brockwell, Richard A. Davis, 2013-11-11 We have attempted in this book to give a systematic account of linear time series models and their application to the modelling and prediction of data collected sequentially in time The aim is to provide specific techniques for handling data and at the same time to provide a thorough understanding of the mathematical basis for the techniques Both time and frequency domain methods are discussed but the book is written in such a way that either approach could be emphasized The book is intended to be a text for graduate students in statistics mathematics engineering and the natural or social sciences It has been used both at the M S level emphasizing the more practical aspects of modelling and at the Ph D level where the detailed mathematical derivations of the deeper results can be included Distinctive features of the book are the extensive use of elementary Hilbert space methods and recursive prediction techniques based on innovations use of the exact Gaussian likelihood and AIC for inference a thorough treatment of the asymptotic behavior of the maximum likelihood estimators of the coefficients of univariate ARMA models extensive illustrations of the techniques by means of numerical examples and a large number of problems for the reader The companion diskette contains programs written for the IBM PC which can be used to apply the methods described in the text *Student Solutions Manual to Accompany Introduction to Time Series Analysis and Forecasting* Douglas C. [Introduction to Time Series and Forecasting](#) Peter J. Brockwell, Richard A. Davis, 2013-03-14 Some of the key mathematical results are stated without proof in order to make the underlying theory accessible to a wider audience The book assumes a knowledge only of basic calculus matrix algebra and elementary statistics The emphasis is on methods and the analysis of data sets The logic and tools of model building for stationary and non stationary time series are developed in detail and numerous exercises many of which make use of the included computer package provide the reader with ample opportunity to develop skills in this area The core of the book covers stationary processes ARMA and ARIMA processes multivariate time series and state space models with an optional chapter on spectral analysis Additional topics include harmonic regression the Burg and Hannan Rissanen algorithms unit roots regression with ARMA errors structural models the EM algorithm generalized state space models with applications to time series of count data exponential smoothing the Holt Winters and ARAR forecasting algorithms transfer function models and intervention analysis Brief introductions are also given to cointegration and to non linear continuous time and long memory models The time series package included in the back of the book is a slightly modified version of the package ITSM published separately as ITSM for Windows by Springer Verlag 1994 It does not handle such large data sets as ITSM for Windows but like the latter runs on IBM PC compatible computers under either DOS or Windows version 3.1 or later The programs are all menu driven so that the reader can immediately apply the techniques in the book to time series data with a minimal investment of time in the computational and algorithmic aspects of the analysis
