Advances in Statistical Methods for the Genetic Dissection of Complex Traits in Plants Yuan-Ming Zhang, Zhenyu Jia, Shang-Qian Xie, Jia Wen, Shibo Wang, Ya-Wen Zhang, 2024-01-26

Genome wide association studies GWAS have been widely used in the genetic dissection of complex traits However there are

still limits in current GWAS statistics For example 1 almost all the existing methods do not estimate additive and dominance effects in quantitative trait nucleotide QTN detection 2 the methods for detecting QTN by environment interaction QEI are not straightforward and do not estimate additive and dominance effects as well as additive by environment and dominance by environment interaction effects leading to unreliable results and 3 no or too simple polygenic background controls have been employed in QTN by QTN interaction QQI detection As a result few studies of QEI and QQI for complex traits have been reported based on multiple environment experiments Recently new statistical tools including 3VmrMLM have been developed to address these needs in GWAS In 3VmrMLM all the trait associated effects including QTN QEI and QQI related effects are compressed into a single effect related vector while all the polygenic backgrounds are compressed into a single polygenic effect matrix These compressed parameters can be accurately and efficiently estimated through a unified mixed model analysis To further validate these new GWAS methods particularly 3VmrMLM they should be rigorously tested in real data of various plants and a wide range of other species
